NCD02-0110

DSP56000/1 FEATURES

- 10.25 Million Instructions Per Second (MIPS)

- Single Cycle, non-pipelined Data ALU
  - 24 x 24 ⟶ 56 Bit Parallel Multiply/Accumulate
  - 10 Data Registers
  - 2 Data Bus Shifter/Limiters

- DSP Oriented Address ALU
  - 24 Address Registers
  - Dual Modulo Arithmetic Units
  - Linear, Modulo, and Bit Reversed Address Generation

- Advanced Program Controller
  - 15 Level Hardware Stack
  - Nested Hardware DO Loops
  - No Overhead Auto-Return Interrupts

- Highly Orthogonal Instruction Set
  - 62 Instruction Types
  - Makes Pipeline Invisible
  - Suitable for High Level Language (HLL) Compilers

- Multiple Buses
  - 4 Data Buses
  - 3 Address Buses
  - Programmable Off-Chip Access Times

- On-Chip Memory
  - Two Independent 256 x 24-Bit Data RAMs
  - Two Independent 256 x 24-Bit Data ROMs
  - 3.75K x 24-Bit Program ROM (DSP56000 Only)
  - 512 x 24-Bit Program RAM (DSP56001 Only)

- On-Chip Peripherals
  - 24 Programmable I/O Port Pins
    or a combination of I/O Port Pins and
  - 8-bit Parallel Host MPU/DMA Interface
  - Serial Communication Port with Baud Rate Generator
  - Synchronous Serial (Codec) Port with Clock Generator

NCD02-0112

DSP56000/1 BLOCK DIAGRAM

DSP56200 FEATURES

CASCADABLE ADAPTIVE FINITE IMPULSE RESPONSE DIGITAL FILTER (CAFIR)

- Three Modes of Operation
  - Single FIR Filter
  - Dual FIR Filter (Two Independent FIR Filters)
  - Single Adaptive FIR Filter
- High Performance Hardware
  - 24 x 16 Bit Multiplication with 40-Bit Accumulation
  - 10.25 MHz Internal Operation
  - 28-Pin Dual-in-Line Package
- Architecture Optimized for Digital Filtering
  - Three Execution Units Operate in Parallel
  - Multiple Internal Buses
- Digital Filtering Features
  - 16-Bit Rounding Option on Filtered Output
  - dc Tap Option
  - Programmable Filter Tap Length (4 to 256 Taps)
  - Programmable Loop Gain
  - Progammable Coefficient Leakage Term
  - Adaptation Disable Capability
  - LMS Adaptation Algorithm
- Unlimited Cascadability Offers
  - Longer-Tap Filters
  - Higher Sampling Rates
- High Throughput Rates – Examples of Possible Configurations
  - 227 kHz FIR Filter (32 Taps, 1 DSP56200)
  - 37 kHz FIR Filter (256 Taps, 1 DSP56200)
  - 115 kHz Adaptive Filter (256 Taps, 8 Cascaded DSP56200s)
  - 19 kHz Adaptive Filter (256 Taps, 1 DSP56200)
  - Many Other Configurations Possible
- Simple Interface to Popular Hosts
  - Microprocessors
  - Microcomputers
  - General Purpose Digital Signal Processors

DSP56200 BLOCK DIAGRAM

DSP56000/1

INTERNAL ARCHITECTURE

AND

PROGRAMMING MODEL

Objectives:

- Describe the Architecture and Programming Model of the DSP56000/1.
- Describe the numeric representation of the DSP56000/1.
- Describe the operation of the DSP56000/1 Status Register.
- Describe the Memory Modes of the DSP56000/1.

NCD02-0200-2

OPERAND TYPES

NCD02-0224

FRACTIONAL VS. INTEGER

NCD02-0225

FRACTIONAL VS. INTEGER MULTIPLICATION

NOTE: Fractional numbers tend to be self-normalizing.

NCD02-0226-1

FRACTIONAL VS. FLOATING POINT

- Greater Dynamic Range
- Less Chance of errors, overflow, underflow, truncation
- Requires large and complex Multiply/Accumulate unit.
- Slow in performance
- Requires more memory
- Expensive, adds to processor cost
- Increases power consumption

NCD02-0227

WORD OPERAND (24 BITS)

Largest Value

$1-2^{-23}$ = $7FFFFF

Smallest Value

-1 = $800000

Dynamic Range

$144dB = 20\log_{10}(2^{24})$

Storage Locations

Program X and Y Memory
Registers X1, X0, Y1, Y0
Accumulators A1, A0, B1, B0

NCD02-0228

FRACTIONAL EXAMPLES

Decimal Fraction	24-Bit Binary Value	Hexadecimal Coefficient
0.750	0.11000000 00000000 00000000	$600000
0.500	0.10000000 00000000 00000000	$400000
0.250	0.01000000 00000000 00000000	$200000
0.125	0.00100000 00000000 00000000	$100000
-0.125	1.11100000 00000000 00000000	$F00000

Accumulators
A,B

NCD02-0236-1

WORD TRANSFERS

NCD02-0237

LONG WORD TRANSFERS

NCD02-0238

HITTING THE RAIL

The OP-AMP has been driven into

"SATURATION"

NCD02-0239

SATURATION ARITHMETIC (LIMITING)

- Minimizes overflow errors when reading Accumulator Data.
- Limiting occurs automatically when transferring from Accumulator A or B into 24 or 48 bit destination.
- Latched in Condition Code Register.
- Contents of A or B are not changed.

NCD02-0240

LIMITING CASES

Destination Memory Reference	Source Operand	Limited Value (Hex) Acc Sign	XD Bus	YD Bus	Type of access
X	X:A X:B	+ -	7FFFFF 800000	---- ----	one 24 bit word
Y	Y:A Y:B	+ -	---- ----	7FFFFF 800000	one 24 bit word
X and Y	X:A Y:A X:A Y:B X:B Y:A X:B Y:B L:AB L:BA	+ -	7FFFFF 800000	7FFFFF 800000	two 24 bit words
L(X:Y)	L:A L:B	+ -	7FFFFF 800000	FFFFFF 000000	one 48 bit long word

Condition Code Register

If Limiting or Overflow occurs then
Limit Bit is set and latched.
Must be cleared by software.

NCD02-0241-1

X AND Y LIMITING

NCD02-0242-1

ROUNDING

The Problem:

10
9
8 } Round Up to 10
7
6
5 **??? Which Way ???**
4
3 } Round Down to 0
2
1
0

Rounding Five to Either Direction Creates a Bias

The Solution: Convergent Rounding or Round to Nearest Even.

NCD02-0243

CONVERGENT ROUNDING

Case I: If A0 < $800000 (1/2), then round down (add nothing)

Before Rounding

After Rounding

Case II: If A0 > $800000 (1/2), then round up (add 1 to A1)

Before Rounding

After Rounding

Case III: If A0 = $800000 (1/2), and the least significant bit of A1 = 0, then round down (add nothing)

Before Rounding

After Rounding

Case IV: If A0 = $8000000 (1/2), and the least significant bit of A1 = 1, then round up (add one)

Before Rounding

After Rounding

- A0 is always cleared.
- Performed During RND, MPYR, MACR.

NCD02-0244

STATUS REGISTER

NCD02-0219

Z, N, AND C CONDITION CODE BITS

A or B
Accumulator

- Zero — Z = 1

- Negative — N = 1

- Carry (Borrow) — C = 1

- Z, N, and C are cleared otherwise

NCD02-0246

V – OVERFLOW BIT

- The Result Cannot be Represented in 56 Bits

$00	000000	000001

+

$7F	FFFFFF	FFFFFF

=

- OVERFLOW V = 1

$80	000000	000000

- OVERFLOW also Sets and Latches the Limit "L" Bit.

NCD02-0247

E – EXTENSION BIT

- E = 0 If all the Bits of the Signed Integer Portion are the same.

The number (n) is a fraction: $+1 > n \geq -1$

Case I

55 … 48	47 … 24	23 … 0
11111111	1.XX • • • XX	XX • • • XX

Radix Point

Case II

55 … 48	47 … 24	23 … 0
00000000	0.XX • • • XX	XX • • • XX

- E = 1 For all other cases

The number (n) is an Integer plus Fraction:

$+256 > n \geq -256$

NCD02-0248

U – UNNORMALIZED BIT

- U = 1 If the two most significant bits of the MSP are the same.

Cleared otherwise

NCD02-0249

SHIFTER / LIMITERS

- SHIFTER Allows Dynamic Scaling without Changing Program Code.
- LIMITING Follows the Scaling Function.
- SHIFT/LIMITER Affects 24 or 48 Bit Data Read from A or B Accumulators onto the X or Y Data Buses
- Contents of Accumulators A or B are Not Changed.

NCD02-0250

SCALING MODE BITS

Status Register

S1	S0	Rounding bit	Scaling Mode
0	0	23	No Scaling
0	1	24	Scale Down (1 bit arithmetic right shift)
1	0	22	Scale Up (1 bit arithmetic left shift)
1	1	--	Reserved for future expansion

- Scaling bits are cleared during reset and long interrupt service routine.
- Affects Convergent Rounding

NCD02-0251

SCALING AND CONVERGENT ROUNDING

- **SCALE DOWN**
  S1 S0
  0 1
- **NO SCALING**
  S1 S0
  0 0
- **SCALE UP**
  S1 S0
  1 0

NCD02-0252

SCALING AND EXTENSION BIT

- **SCALE DOWN**

  S1 S0
  0 1
  E = 0

- **NO SCALING**

  S1 S0
  0 0
  E = 0

- **SCALE UP**

  S1 S0
  1 0
  E = 1

- E = 0 If all the Bits in the Signed Integer Portion are the Same
  else E = 1

NCD02-0253

SCALING AND UNNORMALIZE BIT

- **SCALE DOWN**

  S1 S0
  0 1
  U = 1

- **NO SCALING**

  S1 S0
  0 0
  U = 0

- **SCALE UP**

  S1 S0
  1 0
  U = 1

AMP	55269 - 1	Local Distribution	Zero Insertion Force

NCDX2-0302-1

SIGNAL STATE DEFINITIONS

Assertion (ASSERT)
A signal (pin) is active or true independent of the actual voltage level.

Negation (NEGATE)
A signal (pin) is inactive or false independent of the actual voltage level.

Rescindable (RESCIND)
A signal (pin) is first negated and then three-stated.

NCD02-0303-1

PORTA-EXTERNAL BUS SWITCHES

POWER AND GROUND

CORE PROCESSOR

ADDRESS ARITHMETIC UNITS (AAU)

- Generates up to two independent addresses each Instruction Cycle.
- Performs effective Address calculations.

NCD02-0402

AAU PROGRAMMING MODEL

- Provides storage for 16 bit Addresses, Counters, and Scratch Pad Data
- ALU Registers work in groups of three having the same register number n.
- Address Register Rn, uses Offset Register Nn, and is modified by Register Mn.
- When Calculating Two Effective Addresses one must come from the lower file and the second must come from the upper file.
- When read over the 24 bit Global Data Bus, the register contents are zero extended.
- Due to pipelining, if an A.A.U. register (R,N,M) is changed with a MOVE instruction, the new contents will not be available for use as a pointer until the second following instruction. The assembler flags this with a warning.

NCD02-0404

OPERANDS I

Program Controller Registers

PC	Program Counter Register (16 Bits)
MR	Mode Register (8 Bits)
CCR	Condition Code Register (8 Bits)
SR	Status Register = MR:CCR (16 Bits)
OMR	Operating Mode Register (8 Bits)
LA	Hardware Loop Address Register (16 Bits)
LC	Hardware Loop Counter Register (16 Bits)
SP	System Stack Pointer Register (6 Bits)
SSH	Upper Portion of the Current Top of the Stack (16 Bits)
SSL	Lower Portion of the Current Top of the Stack (16 Bits)
SS	System Stack RAM = SSH:SSL (15 Locations by 32 Bits)

Data ALU Registers

Xn	Input Registers X1 or X0 (24 Bits)
Yn	Input Registers Y1 or Y0 (24 Bits)
An	Accumulator Registers A2, A1, A0 (A2 – 8 Bits, A1 and A0 –24 Bits)
Bn	Accumulator Registers B2, B1, B0 (B2 – 8 Bits, B1 and B0 –24 Bits)
X	Input Register X = X1:X0 (48 Bits)
Y	Input Register Y = Y1:Y0 (48 Bits)
A	Accumulator A = A2:A1:A0 (56 Bits) *
B	Accumulator B = B2:B1:B0 (56 Bits) *
AB	Accumulators A and B = A1:B1 (48 Bits) *
BA	Accumulators B and A = B1:A1 (48 Bits) *
A10	Accumulator A = A1:A0 (48 Bits)
B10	Accumulator B = B1:B0 (48 Bits)

*Note: In data move operations, shifting and limiting is performed when this register is specified as a source operand. When specified as a destination operand, sign extension and possibly zeroing are performed.

Address ALU Registers

Rn	Address Registers R0 thru R7 (16 Bits)
Nn	Address Offset Registers N0 thru N7 (16 Bits)
Mn	Address Modifier Registers M0 thru M7 (16 Bits)

NCD02-0405-1

OPERANDS II

Mode Register (MR) Symbols

LF	Loop Flag Bit Indicating When a DO Loop is in Progress
T	Trace Mode Bit Indicating if the Tracing Function has been Enabled
S1, S0	Scaling Mode Bits Indicating the Current Scaling Mode
I1, I0	Interrupt Mask Bits Indicating the Current Interrupt Priority Level

Condition Code Register (CCR) Symbols (standard definitions)

L	Limit Bit Indicating Arithmetic Overflow and/or Data Shifting/Limiting
E	Extension Bit Indicating if the Integer Portion of A or B is in Use
U	Unnormalized Bit Indicating if the A or B Result is Unnormalized
N	Negative Bit Indicating if Bit 55 of the A or B Result is Set
Z	Zero Bit Indicating if the A or B Result Equals Zero
V	Overflow Bit Indicating if Arithmetic Overflow has Occurred in A or B
C	Carry Bit Indicating if a Carry or Borrow Occurred in A or B Result

Address Operands

ea	Effective Address
eax	Effective Address for X Bus
eay	Effective Address for Y Bus
xxxx	Absolute Address (16 Bits)
xxx	Short Jump Address (12 Bits)
aa	Absolute Short Address (6 Bits, Zero Extended)
pp	I/O Short Address (6 Bits, One's Extended)
<...>	Specifies the Contents of The Specified Address
X:	X Memory Reference
Y:	Y Memory Reference
L:	Long Memory Reference = X:Y
P:	Program Memory Reference

Miscellaneous Operands

S,Sn	Source Operand Register
D,Dn	Destination Operand Register
D[n]	Bit N of D Destination Operand Register
#n	Immediate Short Data (5 Bits)
#xx	Immediate Short Data (8 Bits)
#xxx	Immediate Short Data (12 Bits)
#xxxxxx	Immediate Data (24 Bits)

NCD02-0406-1

Update Mode (U) — The Update Addressing mode is used to modify address registers without any associated data move.

Parallel Mode (P) — The Parallel Addressing mode is used in instructions where two effective addresses are required.

Memory Mode (M) — The Memory Addressing mode is used to refer to operands in memory using an effective addressing field.

Alterable Mode (A) — The Alterable Addressing mode is used to refer to alterable or writable registers or memory.

NCD02-0408

BASIC MOVE INSTRUCTION

MOVE Source 1, Destination 1 [Source 2, Destination 2]

23	0
MOVE Instruction	
(Optional Extension Word)	

Source →	Destination
Register	Register
Register	Memory
Memory	Register

Registers	Memory Space

- Reference is embedded in the instruction
- Instruction Dependent
- Refers to "ALTERABLE" Registers or Memory
  - System Stack Reference
  - Program Controller Register Reference
  - Program Memory Reference

NCD02-0412

IMMEDIATE DATA

Assembler Syntax: #xxxxxx

Operands Referenced: P Memory

24 Bit Destination

Example: MOVE #$123456,A0

Before Execution

After Execution

NCD02-0413

IMMEDIATE DATA INTO ACCUMULATOR

Immediate into 56 bit Accumulator

Example: MOVE #$123456,A

Before Execution

After Execution

Negative Immediate into 56 bit Accumulator

Example: MOVE #$801234,A

Before Execution

After Execution

NCD02-0414

IMMEDIATE SHORT

Eight Bit Data
Assembler Syntax: #xx
Operands Referenced: P Memory

If Destination is A2, A1, A0, B2, B1, B0, R0-R7, N0-N7
then 8 bit Immediate Short Operand is treated as Unsigned Integer.

Example: MOVE #$FF,A1

Before Execution

After Execution

If Destination is X1, X0, Y1, Y0, A,B
then 8 bit Immediate Short Operand is treated as Signed Fraction.

Positive Immediate into 24 bit register
Example: MOVE #$1F,Y1

Before Execution

After Execution

NCD02-0415

IMMEDIATE SHORT INTO ACCUMULATOR

8 Bits, Sign Extended, Zero Filled

Positive Immediate into 56 bit accumulator
Example: MOVE #$1F,A

Before Execution

After Execution

Negative Immediate into 56 bit accumulator
Example: MOVE #$83,B

Before Execution

After Execution

NCD02-0416

ABSOLUTE LONG

16 Bit Address

Assembler Syntax: xxxx

Operands Referenced: P, X, Y, L Memories

Example: MOVE Y:$5432,B0

ABSOLUTE SHORT

6 Bits, Zero Extended

Assembler Syntax: aa

Operands Referenced: P, X, Y, L

Example: MOVE A1,X:3

- Addresses Lowest 64 words
- Interrupt Vectors
- X, Y, L Data RAM
- No Extension Word
- One Word Instruction

SHORT JUMP

12 Bits, Zero Extended

- DSP56000 ROM P:$0000 – P:$0EFF
- DSP56001 RAM P:$0000 – P:$01FF
- Used by Conditional JUMPS and JUMP to Subroutines

NCD02-0419

I/O SHORT

6 Bits, Ones Extended

Assembler Syntax: pp

Operands Referenced: X and Y, I/O Space

Example: MOVEP A1,X:<<$FFFE

* Contents of Bus Control Register after reset

- Upper 64 Words of X or Y Memory
- << indicates I/O short addressing

NCD02-0420-1

ADDRESS REGISTER INDIRECT ADDRESSING MODES

- No Update
- Postincrement by One
- Postincrement by Nn
- Postdecrement by One
- Postdecrement by Nn
- Indexed by Offset Nn
- Predecrement by 1
- All Modes of Address Register Indirect use the Mn Modifier Registers.

NCD02-0421

NO UPDATE

- Assembler Syntax: (Rn)
- Operands referenced: P, X, Y, XY, L memories.

Example: MOVE A1, X:(R0)

NCD02-0422

POST INCREMENT BY ONE

- Assembler Syntax: (Rn) +
- Operands referenced: P, X, Y, XY, L memories.

Example: MOVE B0,Y:(R1) +

NCD02-0423

POSTDECREMENT BY ONE

- Assembler Syntax: (Rn) -
- Operands referenced: P, X, Y, XY, L memories.

Example: MOVE Y0,Y:(R3) -

POSTINCREMENT BY OFFSET Nn

- Assembler Syntax: (Rn) + Nn
- Operands referenced: P, X, Y, L, XY memories.

Example: MOVE X1, X:(R2) + N2

POSTDECREMENT BY OFFSET Nn

- Assembler Syntax: (Rn) - Nn
- Operands referenced: P, X, Y, L memories.

Example: MOVE X:(R4) - N4, A0

PREDECREMENT BY ONE

- Assembler Syntax: -(Rn)
- Operands referenced: P, X, Y, L memories.

Example: MOVE X:- (R5), B1

INDEXED BY OFFSET Nn

- Assembler Syntax: (Rn + Nn)
- Operands referenced: P, X, Y, L memories.

Example: MOVE Y1,X:(R6+N6)

MODIFIER REGISTERS

USED BY ALL FORMS OF ADDRESS REGISTER INDIRECT

No Update	(Rn)
Postincrement by 1	(Rn)+
Postdecrement by 1	(Rn)-
Postincrement by Offset Nn	(Rn)+Nn
Postdecrement by Offset Nn	(Rn)-Nn
Indexed by Offset Nn	(Rn+Nn)
Predecrement by 1	-(Rn)

- Modifier register Mn alters the effective address that is derived from Rn and Nn.

NCD02-0430-1

MODIFIER REGISTER VALUES

MODIFIER Mn VALUE	ADDRESSING MODE ARITHMETIC
0	Reverse Carry (Bit Reversed)
1	Modulo 2
2	Modulo 3
⋮	⋮
⋮	Modulo (Mn + 1)
⋮	⋮
32766	Modulo 32767
32767	Modulo 32768
⋮	Reserved
65535	Linear (Modulo 65536) (RESET)

NCD02-0431

MODULO M ADDRESSING APPLICATIONS

Applications

F.I.F.O.'s
Circular Queues
Delay Lines
Shift Registers
Sample Buffers
Finite Sum of Products

NCD02-002

CIRCULAR QUEUE

HEAD

R2 [HEAD] N2 [XXXX] M2 [M-1]

Add To Head: **MOVE X0,X:(R2)+**
Remove From Head: **MOVE X:-(R2),X0**

TAIL

R5 [TAIL] N5 [XXXX] M5 [M-1]

Add To Tail: **MOVE X1,X:-(R5)**
Remove From Tail: **MOVE X:(R5)+,X1**

• CAUTION– This does not look out for Head and Tail Crashes.
(i.e. Queue Overflow and Underflow)

NCD02-003

MODULO M REGISTER SETUP

1. Modifier Register Mn = M-1. — MODULUS =M

2. Lower Bound = $\overset{15}{XX}\ldots XX00\ldots\overset{0}{00}$ where $2^J \geq M$ — Beginning of Table (Minimize J)

   ($\leftarrow J \rightarrow$)

3. Upper Bound = $\overset{15}{XX}\ldots XX00\ldots\overset{0}{00} + M - 1$ — End of Table

   ($\leftarrow J \rightarrow$)

4. Lower Bound ≤ Address Register Rn ≤ Upper Bound — Starting Point within Table

5. Offset Register Nn = Increment ≤ M — Desired Increment (if any)

NCD02-0434

MODULO M ADDRESSING EXAMPLE

Example: MOVE X0,X:(R0)+N0

NOTE: This example is in decimal.

NCD02-0435

FAST FOURIER TRANSFORM BUTTERFLY

Radix 2, decimation in time, complex FFT butterfly

Schematic Symbol

NCD02-0436-1

8 POINT FFT TRANSFORM

NCD02-0437-1

BIT REVERSED REGISTER SETUP FOR N POINT FFT

1. Modifier Register Mn = $0000

   N = Table Size
   Select Bit Reverse Addressing Mode

2. Lower Bound = $\overset{15}{XX} \ldots XX00 \ldots \overset{0}{00}$ where $2^K \geq N$

   $\underbrace{\hspace{2em}}_{K}$

   Beginning of Table
   (Minimize K)

3. Upper Bound = $\overset{15}{XX} \ldots XX00 \ldots \overset{0}{00} + 2^K - 1$

   $\underbrace{\hspace{2em}}_{K}$

   End of Table

4. Lower Bound ≤ Address Register Rn ≤ Upper Bound

   Starting Point within Table

5. Offset Register Nn = 2^{K-1}

   Initialize Offset Register

NCD02-0438-1

BIT REVERSED/REVERSE CARRY ALGORITHM

N = 1024

K = 10

Lower Bound = 3 x N = 3 x 1024 = 3072

Upper Bound = 3 x N + 2^K – 1 = 3072 + 1024 – 1 = 4095

Bit Reversed

```
                    K
4041 = 0 0 0 0 1 1 | 1 1 1 1 0 0 1 0 0 1
Reverse K LSB's

3663 = 0 0 0 0 1 1 | 1 0 0 1 0 0 1 1 1 1
 +1    No Carry      Increment K LSB's
       Beyond K LSB'S
3664 = 0 0 0 0 1 1 | 1 0 0 1 0 1 0 0 0 0
Reverse K LSB's

3113 = 0 0 0 0 1 1 | 0 0 0 0 1 0 1 0 0 1
```

Reversed Carry

```
                    K
4041 = 0 0 0 0 1 1 | 1 1 1 1 0 0 1 0 0 1
Increment Kth Bit  | +1

Propagate Carry    |
from Left to Right | 1 1 1 1 0 0 0 0 0
                   | ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑ ↑
3113 = 0 0 0 0 1 1 | 0 0 0 0 1 0 1 0 0 1
```

DSP56000 INSTRUCTION SET

- MPU like
- Makes pipeline invisible
- 62 instructions
- 6 groups
  - Move instructions
  - Arithmetic instructions†
  - Logical instructions †
  - Bit manipulation instructions
  - Program control instructions
  - Loop instructions
- 30 instructions allow parallel moves

† Most arithmetic and logical instructions allow parallel data moves.

NCD02-0501

PARALLEL DATA MOVE INSTRUCTIONS

- **Syntax:**

Opcode	Operands	Parallel Move: X Bus Data (Source 1 → Destination 1)	Parallel Move: Y Bus Data (Source 2 → Destination 2)
MACR	-X0, Y0, A	X:(R0) + ,X0	Y:(R4) - ,Y0

Specifies:

- Data ALU Operation
- Logical Operation
- Convergent Rounding

Supports:

- Condition Code Bits 0 through 5

Specifies:

- Up to two optional data transfers
- Two different addressing modes
- Address space qualifiers [X:, Y:, L:, P:, XY:]

Supports:

- Scaling
- Limiting
- Sign extension and least significant zero fill
- Duplicate sources
- Duplicate destinations <u>not allowed</u>

NCD02-0502

PARALLEL DATA MOVE OPERATIONS

Parallel Data Move

MACR -X0, Y0, A

1. Negate X0
2. 24 x 24 Bit Multiply
   X0 x Y0
3. 56 Bit Sum into Accumulator A
4. Convergently Round A
5. Update Condition Code Register

A,X:(R0)+N0

6. MOVE A to X Memory
7. Scale
8. Limit (If Necessary)
9. Calculate Next Address (R0)+ N0
10. Use Modifier Register M0 For
    - Linear Addressing
    - Modulo M
    - Bit Reverse

Y:(R4)-N4,B

11. MOVE Y Memory to B
12. Sign extend and Zero fill
13. Calculate Next Address (R4) - N4
14. Use Modifier Register M4 For
    - Linear Addressing
    - Modulo M
    - Bit Reverse

- This All Occurs In 97.5 nS.

NCD02-0503

PARALLEL MOVE TYPES

- No Parallel Move
- Immediate Short Data Move
- Register to Register Data Move
- Address Register Update
- X Memory Data Move
- X Memory and Register Data Move
- Y Memory Data Move
- Register and Y Memory Data Move
- Long Memory Data Move
- XY Memory Data Move

NCD02-0504

PARALLEL MOVE RULES

- Duplicate Sources Are Permitted

  A ⟶ X Memory and A ⟶ Y Memory

- Duplicate Destinations Are Not Permitted!!!

  X Memory ⟶ A
  Y Memory ⟶ A

- If An Accumulator is a Source, Then Shifting or Limiting may occur.

  Accumulator ⟶ Shifter/Limiter ⟶ Destination

- If An Accumulator is a Destination Then Sign Extension and Least Significant Zero Fill Occurs.

  Source Data ⟶ Accumulator: Sign Ex. | Source Data | 0 ——— 0

- Due to pipelining, If an Address Register is changed using a Move Type Instruction, the new contents of the destination Address Register will not be available for use during the folowing instruction.

  – There is a single instruction pipeline delay.

  – This is flagged as a warning by the assembler.

NCD02-0524

PARALLEL DATA MOVE OPERATIONS

Parallel Data Move

MACR -X0, Y0, A

1. Negate X0
2. 24 x 24 Bit Multiply
   X0 x Y0
3. 56 Bit Sum into Accumulator A
4. Convergently Round A
5. Update Condition Code Register

A,X:(R0)+N0

6. MOVE A to X Memory
7. Scale
8. Limit (If Necessary)
9. Calculate Next Address (R0)+ N0
10. Use Modifier Register M0 For
    - Linear Addressing
    - Modulo M
    - Bit Reverse

Y:(R4)-N4,B

11. MOVE Y Memory to B
12. Sign extend and Zero fill
13. Calculate Next Address (R4) - N4
14. Use Modifier Register M4 For
    - Linear Addressing
    - Modulo M
    - Bit Reverse

• This All Occurs In 97.5 nS.

NCD02-0503

PARALLEL MOVE TYPES

- No Parallel Move
- Immediate Short Data Move
- Register to Register Data Move
- Address Register Update
- X Memory Data Move
- X Memory and Register Data Move
- Y Memory Data Move
- Register and Y Memory Data Move
- Long Memory Data Move
- XY Memory Data Move

NCD02-0504

PARALLEL MOVE RULES

- Duplicate Sources Are Permitted

A ⟶ X Memory and A ⟶ Y Memory

- Duplicate Destinations Are Not Permitted!!!

- If An Accumulator is a Source, Then Shifting or Limiting may occur.

- If An Accumulator is a Destination Then Sign Extension and Least Significant Zero Fill Occurs.

- Due to pipelining, If an Address Register is changed using a Move Type Instruction, the new contents of the destination Address Register will not be available for use during the folowing instruction.

  – There is a single instruction pipeline delay.

  – This is flagged as a warning by the assembler.

NCD02-0524

16 BIT TRANSFERS

IMMEDIATE SHORT DATA MOVE

Assembler Syntax:

Opcode	Operand	PARALLEL MOVE
		#xx, Destination

Addressing Modes

Source Operand		Destination Registers	
Immediate Short (8 Bits)	#xx	A2, A1, A0 B2, B1, B0 R0 – R7 N0 – N7	Unsigned Integer Transfer to Least Significant Portion
		X1, X0 Y1, Y0 A,B	Signed Fraction Transfer

NCD02-0505

IMMEDIATE SHORT EXAMPLES

Unsigned Integer

Example 1:

Opcode	Operand	PARALLEL MOVE
ADD	A,B	#$25,A0

Before Execution

A	01	000001	000001
B	06	FFFFFE	FFFFFE

After Execution

A	01	000001	000025
B	07	FFFFFF	FFFFFF

Signed Fraction

Example 2:

Opcode	Operand	PARALLEL MOVE
ADD	B,A	#$C7,B

Before Execution

A	01	000001	000001
B	01	000001	000001

After Execution

A	02	000002	000002
B	FF	C70000	000000

NCD02-0506

REGISTER TO REGISTER DATA MOVE

Assembler Syntax:

Opcode	Operand	PARALLEL MOVE
		Source, Destination

Addressing Modes

Source Registers	Destination Registers
X1, X0	X1, X0
Y1, Y0	Y1, Y0
A, A2, A1, A0	A, A2, A1, A0
B, B2, B1, B0	B, B2, B1, B0
R0 – R7	R0 – R7
N0 – N7	N0 – N7

NCD02-0507

REGISTER TO REGISTER EXAMPLES

Example 1:

Opcode	Operand	PARALLEL MOVE
ADD	B,A	A,N7

Before Execution

A	00	123456	ABCDEF
B	12	654321	9ABCDE
N7	0000		

After Execution

A	12	777778	468ACD
B	12	654321	9ABCDE
N7	3456		

Example 2:

Opcode	Operand	PARALLEL MOVE
ADD	B,A	B,R7

Before Execution

A	FE	DCBA98	765432
B	12	345678	9ABCDE
R7	1234		

After Execution

A	11	111111	111110
B	12	345678	9ABCDE
R7	FFFF		

Limiting has occurred

NCD02-0508

ADDRESS REGISTER UPDATE

Assembler Syntax: Opcode	Operand	PARALLEL MOVE
		<Effective Address>

Addressing Modes

Effective Address:		Address Register
Postincrement by 1	(Rn)+	R0-R7
Postdecrement by 1	(Rn)-	
Postincrement by Offset Nn	(Rn)+Nn	
Postdecrement by Offset Nn	(Rn)-Nn	

NCD02-0509

ADDRESS REGISTER UPDATE EXAMPLES

Example 1: Opcode ADD, Operand A,B, PARALLEL MOVE (R1)+N1

Before Execution

A	11	222222	333333
B	44	555555	666666
R1	2000		
N1	F000		

After Execution

A	11	222222	333333
B	55	777777	999999
R1	1000		
N1	F000		

Example 2: Opcode ADD, Operand A,B, PARALLEL MOVE (R0)-

Before Execution

A	12	345678	9ABCDE
B	12	345678	9ABCDE
R0	2000		

After Execution

A	12	345678	9ABCDE
B	24	68ACF1	3579BC
R0	1FFF

XY MEMORY DATA MOVE EXAMPLES

PARALLEL MOVE SUMMARY

	Opcode/Operands	Parallel Move Examples	
Immediate Short Data	ADD X0,A	#$05,Y1	
Register to Register	ADD X0,A	A1,Y0	
Address Register Update	ADD X0,A	(R0)+N0	
X Memory	ADD X0,A	X0,X:(R3)+	
X Memory plus Register	ADD X0,A	X:(R4)–,X1	A,Y0
Y Memory	ADD X0,A	Y:(R6)+N6,X0	
Y Memory plus Register	ADD X0,A	A,X0	B,Y:(R0)
L Memory	ADD X0,A	L:-(R2),AB	
XY Memory	ADD X0,A	X1,X:(R1) +N1	Y1,Y:(R5)+N5

NCD02-0523

MOVE INSTRUCTION

Mnemonic	Operation	Assembler Syntax
MOVE	Move Data Registers S → D	MOVE S,D

Operand Combinations

Source	Destination
All Parallel Move Combinations	

• Equivalent to a Data ALU NOP.

NCD02-0526

MOVE CONTROL REGISTER

Mnemonic	Operation	Assembler Syntax
MOVEC	Move Data Registers S → D	MOVE(C) S,D

Operand Combinations

Source or Destination		Source or Destination Control Registers
X1,X0 Y1,Y0 A,A2,A1,A0 B,B2,B1,B0 R0 – R7 M0 – M7 SR OMR SP,SSH,SSL LA,LC	↔	M0-M7 SR OMR SP,SSH,SSL LA,LC
Immediate Data	#xxxxxx	
Immediate Short Data	#xx	
X or Y memory;		
Absolute Address	xxxx	
Absolute Short Address	aa	
Address Register Indirect with;		
No Update	(Rn)	
Postincrement by 1:	(Rn)+	
Postdecrement by 1:	(Rn)-	
Postincrement by Offset Nn	(Rn)+Nn	
Postdecrement by Offset Nn	(Rn)-Nn	
Indexed by Offset Nn	(Rn+Nn)	
Predecrement by 1	-(Rn)	

Example: MOVE SSL,LC

• Refer to Instruction Set Details for Restrictions.

NCD02-0527

MOVE PROGRAM MEMORY

Mnemonic	Operation	Assembler Syntax
MOVEM	Move Program Memory S → P:<ea> P:<ea> → D	MOVE(M) S,P:<ea> MOVE(M) P:<ea>,D

Operand Combinations

PROGRAM Memory, Effective Address			Source or Destination
Absolute Short Address	aa		X1,X0
Absolute Address	xxxx		Y1,Y0
Address Register Indirect with;			A,A2,A1,A0
No Update	(Rn)	↔	B,B2,B1,B0
Postincrement by 1:	(Rn)+		R0 - R7
Postdecrement by 1:	(Rn)-		N0 - N7
Postincrement by Offset Nn	(Rn)+Nn		M0 - M7
Postdecrement by Offset Nn	(Rn)-Nn		SR
Indexed by Offset Nn	(Rn+Nn)		OMR
Predecrement by 1	-(Rn)		SP,SSH,SSL
			LA,LC

Example 1: MOVE M3, P:(R3)-N3

Example 2: MOVE P:$0000, LC

• Refer to Instruction Set Details for Restrictions.

NCD02-0528

MOVE PERIPHERAL DATA

Mnemonic	Operation	Assembler Syntax

MOVEP	Move Peripheral Data
	S → X or Y Peripheral
	X OR Y Peripheral → D
		MOVEP S,X:<pp>
		MOVEP S,Y:<pp>
		MOVEP X:<pp>,D
		MOVEP Y:<pp>,D

Operand Combinations

Source or Destination

X1,X0
Y1,Y0
A,A2,A1,A0
B,B2,B1,B0
R0 – R7
N0 - N7
M0 – M7
SR
OMR
SP,SSH,SSL
LA,LC

X,Y, or PROGRAM memory;

Absolute Address	xxxx
Immediate Data	#xxxxxx
Address Register Indirect with;	
No Update	(Rn)
Postincrement by 1	(Rn)+
Postdecrement by 1	(Rn)-
Postincrement by Offset Nn	(Rn)+Nn
Postdecrement by Offset Nn	(Rn)-Nn
Indexed by Offset Nn	(Rn+Nn)
Predecrement by 1	-(Rn)

X OR Y
I/O Space

Example 1: MOVEP X:(R3+N3), Y:$FFC0

Example 2: MOVEP X:$FFFF, A

- The Only Memory to Memory Transfer Instruction.

NCD02-0529

MOVEC MOVEM AND MOVEP USED WITH SSH

SSH As a Source

SSH → Destination
SP -1 → SP

SSH As a Destination

S P + 1 → SP
Source → SSH

Example 1: MOVEC SSH, X:0

Example 2: MOVEM P:0, SSH

NCD02-0530

LOAD UPDATED ADDRESS

Mnemonic	Operand Size	Operation	Assembler Syntax
LUA	16	Load Updated Address <ea> → D	LUA <ea>, D

Operand Combinations

Effective Addressing Modes	<ea>	Destinations
Postincrement by 1	(Rn)+	R0-R7
Postdecrement by 1	(Rn)-	N0-N7
Postincrement by Offset Nn	(Rn)+Nn	
Postdecrement by Offset Nn	(Rn)-Nn	

NOTE: The Source Effective Address is NOT Updated.

NCD02-0531

LOAD UPDATED ADDRESS EXAMPLES

Example 1: LUA (R4)-,R3

	Before Execution	After Execution
R3	X X X X	4 F F F
R4	5 0 0 0	5 0 0 0

Example 2: LUA (R1)-N1,N7

	Before Execution	After Execution
R1	7 A 3 D	7 A 3 D
N1	6 9 D C	6 9 D C
N7	X X X X	1 0 6 1

NCD02-0532

ADDITION AND SUBTRACTION ARITHMETIC INSTRUCTIONS

Mnemonic	Operand Size	Operation	Assembler Syntax
ADD	24,48,56	Addition S + D → D	ADD S,D [Parallel Move]
SUB	24,48,56	Subtraction D - S → D	SUB S,D [Parallel Move]

Operand Combinations

A,B	Y, A or B
B,A	Y1,A or B
X,A or B	Y2,A or B
X1,A or B	
X2,A or B	

NOTE: Adding or Subtracting an Accumulator from itself is NOT Allowed.

Mnemonic	Operand Size	Operation	Assembler Syntax
ADC	48,56	Addition S + D + C → D	ADC S,D [Parallel Move]
SBC	48,56	Subtraction D - S - C → D	SBC S,D [Parallel Move]

Operand Combinations

X,A	X,B
Y,A	Y,B

NCD02-0533-1

ADDITION AND SUBTRACTION ARITHMETIC INSTRUCTION EXAMPLES

Example 1: SUB X,B [Optional Parallel Move]

Before Execution

X [7FFFFF | FFFFFF]

B [FF | FFFFFF | FFFFFF]

After Execution

X [7FFFFF | FFFFFF]

B [FF | 800000 | 000000]

Example 2: ADC Y,A [Optional Parallel Move]

Before Execution

Carry [1]

Y [7FFFFF | FFFFFF]

A [0F | 800000 | 000000]

After Execution

Carry [0]

Y [7FFFFF | FFFFFF]

A [10 | 000000 | 000000]

NCD02-0534

SHIFT AND ADD OR SUBTRACT ARITHMETIC INSTRUCTIONS

Mnemonic	Operand Size	Operation	Assembler Syntax
ADDR	56	Arithmetic Shift Right and Add Accumulators S + D/2 → D	ADDR S,D [Parallel Move]
SUBR	56	Arithmetic Shift Right and Subtract Accumulators D/2 - S → D	SUBR S,D [Parallel Move]
ADDL	56	Shift Left and Add Accumulators S + 2 x D → D	ADDL S,D [Parallel Move]
SUBL	56	Shift Left and Subtract Accumulators 2 x D - S → D	SUBL S,D [Parallel Move]

Operand Combinations

Source	Destination
A	B
B	A

- The SHIFT Occurs Prior to the Arithmetic Operation.
- These Instructions are useful for Efficient Divide and Decimation in Time (DIT) Fast Fourier Transform (FFT) Algorithms.

NCD02-0535

SHIFT AND ADD OR SUBTRACT ARITHMETIC INSTRUCTION EXAMPLES

Example 1: ADDR A,B [Optional Parallel Move]

Before Execution

A | 00 | 13579B | 000000

B | C0 | 000000 | 2468AC

After Execution

A | 00 | 13579B | 000000

B | E0 | 13579B | 123456

Example 2: SUBL A,B [Optional Parallel Move]

Before Execution

A | 00 | 004000 | 000000

B | 00 | 005000 | 000001

After Execution

A | 00 | 004000 | 000000

B | 00 | 006000 | 000002

NCD02-0536

MULTIPLY ARITHMETIC INSTRUCTIONS

Mnemonic	Operand Size	Operation	Assembler Syntax
MPY	24, 56	Signed Multiply ± (S1 * S2) → D	MPY (±) S1, S2, D [Parallel Move]
MPYR	24, 56	Signed Multiply and Round ± (S1 * S2) + r → D	MPYR (±) S1, S2, D [Parallel Move]

Operand Combinations

Source 1	Source 2	Destination
X0	X0	A or B
Y0	Y0	
X1	X0	
Y1	Y0	
X0	Y1	
Y0	X0	
X1	Y0	
Y1	X1	

Only these combinations of Source1 and Source2 are valid.
X1 * X1 and Y1 * Y1 are <u>not</u> valid.

NCD02-0537-1

MULTIPLY ARITHMETIC INSTRUCTION EXAMPLES

Example 1: MPY -X0,X0,A [Optional Parallel Move]

Before Execution

X | ABCDEF | 400000 | X0 = 1/2

A | 12 | 345678 | 9ABCDE

After Execution

X | ABCDEF | 400000

A | FF | E00000 | 000000 | A = -1/4

Example 2: MPY Y1, Y0, B [Optional Parallel Move]

Before Execution

Y | 400000 | 000007

Y1 = 1/2

B | 12 | 345678 | ABCDEF

After Execution

Y | 400000 | 000007

B | 00 | 000003 | 800000

Example 3: MPYR Y1, Y0, B [Optional Parallel Move]

Before Execution

Y | 400000 | 000007

Y1 = 1/2

B | 12 | 345678 | ABCDEF

After Execution

Y | 400000 | 000007

B | 00 | 000004 | 000000

NCD02-0538

MULTIPLY AND ACCUMULATE INSTRUCTIONS

Mnemonic	Operand Size	Operation	Assembler Syntax
MAC	24, 56	$D \pm (S1 * S2) \longrightarrow D$	MAC ± S1, S2, D [Parallel Move]
MACR	24, 56	$D \pm (S1 * S2) + r \longrightarrow D$	MACR ± S1, S2, D [Parallel Move]

Operand Combinations

Source 1	Source 2	Destination
X0	X0	A or B
Y0	Y0	
X1	X0	
Y1	Y0	
X0	Y1	
Y0	X0	
X1	Y0	
Y1	X1	

- Only These Combinations of Source 1 and Source 2 are valid. X1 * X1 and Y1 * Y1 are <u>not</u> valid.
- These Instructions are the Basis for <u>All</u> Digital Filtering Algorithms!

NCD02-0539

MULTIPLY AND ACCUMULATE INSTRUCTION EXAMPLES

Example 1: MAC X1, Y1, A [Optional Parallel Move]

Before Execution

X	000002	000000
Y	000003	000000
A	00	000004	000000

After Execution

X	000002	000000
Y	000003	000000
A	00	000004	00000C

Example 2: MACR X0, Y0, B [Optional Parallel Move]

Before Execution

X	200000	400000
		X0 = 1/2
Y	010000	000003
B	00	000004	000000

After Execution

X	200000	400000
Y	010000	000003
B	00	000006	000000

NCD02-0540

ARITHMETIC SHIFT

Mnemonic	Operand Size	Operation	Assembler Syntax
ASR	56	Arithmetic Shift Right (55, 47, 23, 0 → C)	ASR D [Parallel Move]
ASL	56	Arithmetic Shift Left (C ← 55, 47, 23, 0 ← 0)	ASL D [Parallel Move]

Destination
A,B

Example 1: ASR A

Before Execution

A | 88 | 888888 | 111111 — Carry: 0

After Execution

A | C4 | 444444 | 088888 — Carry: 1

Example 2: ASL B

Before Execution

Carry: 0 — B | C0 | F11111 | 888888

After Execution

Carry: 1 — B | 81 | E22223 | 111110

NCD02-0541

COMPARE ARITHMETIC INSTRUCTIONS

Mnemonic	Operand Size	Operation	Assembler Syntax
CMP	24, 56	Compare D - S	CMP S,D [Parallel Move]
CMPM	24, 56	Compare Magnitude |D| - |S|	CMPM S,D [Parallel Move]
TST	56	Test Accumulator D - 0	TST D [Parallel Move]

Operand Combinations

Source	Destination
A	B
B	A
X1,X0	A,B
Y1,Y0	A,B

• The result from the subtract is not stored, the condition code register is updated.

NCD02-0542

AFFECT OF ARITHMETIC INSTRUCTIONS ON CONDITION CODES

Instruction Syntax:

Status Register

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
LF	0	T	0	S1	S0	I1	I0	0	L	E	U	N	Z	V	C
MR No Effect								CCR							

L - Set if limiting (parallel move) or overflow has occured in result (Latched Bit)

E - Set if the signed integer portion of result is in use

U - Set if result is unnormalized

N - Set if bit 55 of result is set

Z - Set if result equals zero

V - Set if overflow has occured in result

C - Set if a carry (or borrow) occurs from bit 55 of result

• The definition of the E and U bits varies according to the scaling mode being used. NCD02-0543

TRANSFER INSTRUCTIONS

Mnemonic	Operand Size	Operation	Assembler Syntax
TFR	24, 56	Transfer Data ALU Register S → D	TFR S,D [Parallel Move]
Tcc	16, 24, 56	Conditionally Transfer Data ALU Registers If cc Then S1 → D1 or If cc Then S1 → D1 and S2 → D2	Tcc S1,D1 [S2,D2]

Operand Combinations

Source1	Destination1	Source 2	Destination 2
A	B	R0-R7	R0-R7
B	A		
X1,X0	A,B		
Y1,Y0	A,B		

- Performs transfer without shifting or limiting.
- Uses internal ALU data paths.
- Does not affect Condition Code bits.

Tcc Test Conditions

"cc" Mnemonic			Condition
CC (HS)	-	carry clear (higher or same)	C=0
CS (LO)	-	carry set (lower)	C=1
EC	-	extension clear	E=0
EQ	-	equal	Z=1
ES	-	extension set	E=1
GE	-	greater than or equal	$N \oplus V = 0$
GT	-	greater than	$Z+(N \oplus V) = 0$
LC	-	limit clear	L=0
LE	-	less than or equal	$Z+(N \oplus V) = 1$
LS	-	limit set	L=1
LT	-	less than	$N \oplus V = 1$
MI	-	minus	N= 1
NE	-	not equal	Z= 0
NR	-	normalized	$Z+(\overline{U} \cdot \overline{E}) = 1$
PL	-	plus	N= 0
NN	-	not normalized	$Z+(\overline{U} \cdot \overline{E}) = 0$

NCD02-0544

TRANSFER EXAMPLE

Example: TFR A, B A, X: (R6) + N6 B, Y:(R3)-

Status Register

15							8	7							0
LF	0	T	0	1	0	I1	I0	0	L	E	U	N	Z	V	C

S1, S0 – Scale Up

Before Execution

A | 00 | 4080A0 | C0E000

B | 00 | 203050 | A0B0C0

R6 | 7101 | R3 | 0001

N6 | FFFF

X Memory $7101: XXXXXX

Y Memory $0001: XXXXXX

After Execution

A | 00 | 4080A0 | C0E000

B | 00 | 4080A0 | C0E000

R6 | 7100 | R3 | 0000

N6 | FFFF

X Memory $7101: 7FFFFF

Y Memory $0001: 4060A1

- Limiting has occurred on the transfer to X Memory.
- TFR using the Parallel MOVE option creates a three Move Instruction.

NCD02-0545-1

CONDITIONAL TRANSFER EXAMPLE

- Tcc used after CMP or CMPM can perform many useful functions like selectively transfer.

Maximum Value
Minimum Value
Maximum Absolute Value
Minimum Absolute Value

Example: Scan Memory to find the largest value in an array.

```
MOVE   X: -(R0), X0
CMP    X0, A
TLT    X0, A      R0, R1
```

Loop

If A< X0
Then X0 → A R0 → R1
Else NOP

NCD02-0546

ARITHMETIC INSTRUCTIONS

Mnemonic	Operand Size	Operation	Assembler Syntax
NEG	56	Negate 0 - D → D	NEG D [Parallel Move]
NORM	16, 56	Normalize Accumulator Iteration If $\overline{E} \cdot U \cdot \overline{Z} = 1$, then ASL D and Rn - 1 → Rn Else If E = 1, then ASR D and Rn + 1 → Rn Else NOP	NORM Rn,D Parallel Move not allowed
RND	56	Round Accumulator D + r → D	RND D [Parallel Move]
ABS	56	Absolute Value |D| → D	ABS D [Parallel Move]
CLR	56	Clear Accumulator 0 → D	CLR D [Parallel Move]

Operand Combinations

Destination	Register Rn
A,B	R0-R7

NCD02-0547-1

ARITHMETIC INSTRUCTION EXAMPLES

Example 1: NEG A

[Optional Parallel Move]

Before Execution

A	00	0012F0	000000

After Execution

A	FF	FFED10	000000

Example 2: Normalize Accumulator A.

	R0	A
NORM R0, A	0000	00 100000 001248
NORM R0, A	FFFF	00 200000 002490
NORM R0, A	FFFE	00 400000 004920
	FFFE	00 400000 004920

- R0 Contains the Number of Bits shifted to Normalize the Accumulator
  If R0<0 then the Shift was to the left.
  If R0>0 then the Shift was to the right.
- Only does one bit of normalization at a time.
  Maximum to normalization is >46.

NCD02-0548-1

LOGICAL INSTRUCTIONS

Mnemonic	Operand Size	Operation	Assembler Syntax
AND	24	Logical AND S • D [47:24] → D [47:24]	AND S, D [Parallel Move]
OR	24	Logical Inclusive OR S + D [47:24] → D [47:24]	OR S, D [Parallel Move]
EOR	24	Logical Exclusive OR S ⊕ D [47:24] → D [47:24]	EOR S, D [Parallel Move]
NOT	24	Logical Complement $\overline{D}$ [47:24] → D [47:24]	NOT D [Parallel Move]

Operand Combinations

Source	Destination
X1, X0 Y1, Y0	A, B

NCD02-0549

LOGICAL INSTRUCTION EXAMPLES

Example 1: AND Y0, B

Before Execution

Y	123456	F84210
B	FF	0FFFFF FFFFFF

After Execution

Y	123456	F84210
B	FF	084210 FFFFFF

Example 2: EOR X1, A

Before Execution

X	F84210	123456
A	FF	FFFFFF FFFFFF

After Execution

X	F84210	123456
A	FF	07BDEF FFFFFF

NCD02-0550

IMMEDIATE LOGICAL INSTRUCTIONS

Mnemonic	Operand Size	Operation	Assembler Syntax
ANDI	8	AND Immediate with Control Register #xx • D → D	AND(I) #xx, D
ORI	8	OR Immediate with Control Register #xx + D → D	OR(I) #xx, D

Operands
Destinations

MR
CCR
OMR

- Does not support parallel moves.
- If destination is the MR or OMR, then the CCR is not affected.
- If the CCR is the destination, then bits 0 through 6 are set or cleared according to the operation.

NCD02-0551

IMMEDIATE LOGICAL INSTRUCTION EXAMPLES

Example 1: ANDI #%11111100, OMR

- Puts processor in Mode 0
- Does not change other bits

Example 2: ORI #%00000010, OMR

- Sets MB Bit, all others are unchanged

Example 3: ORI #%00001111, CCR

- Sets N, Z, V, and C bits in the CCR.
- The L, E, and U bits are unchanged.

NCD02-0552-1

SHIFT AND ROTATE INSTRUCTIONS

Mnemonic	Operand Size	Operation	Assembler Syntax
LSL	24	Logical Shift Accumulator Left C ← [47 … 24] ← 0	LSL D [Parallel Move]
ROL	24	Rotate Accumulator Left C ← [47 … 24] ← C	ROL D [Parallel Move]
LSR	24	Logical Shift Accumulator Right 0 → [47 … 24] → C	LSR D [Parallel Move]
ROR	24	Rotate Accumulator Right C → [47 … 24] → C	ROR D [Parallel Move]

Operands
Destination
A, B

NCD02-0553

SHIFT AND ROTATE INSTRUCTION EXAMPLES

Example 1: LSR A

Before Execution

A | 80 | 822222 | 111111

Carry 1

After Execution

A | 80 | 411111 | 111111

Carry 0

Example 2: ROL B

Before Execution

B | F0 | 00000E | F0000F

Carry 1

After Execution

B | F0 | 00001D | F0000F

Carry 0

NCD02-0554-1

REPEAT NEXT INSTRUCTON

Mnemonic	Operation	Assembler Syntax
REP	LC → TEMP; #xxx → LC Repeat Next Instruction Until LC = 1 TEMP → LC	REP #xxx REP X:<ea> REP Y:<ea> REP S

#xxx Static Loop Count	X or Y Dynamic Loop Count Effective Address MODES:		S Dynamic Loop Count Operands:

	Predecrement by 1	-(Rn)	R0-R7
			N0-N7
			M0-M7

NCD02-0561

REPEAT NEXT INSTRUCTION EXAMPLES

Example 1:

```
REP   X0                                  ; Take the 16 Least Significant bits of X0
MAC   X1,Y1,A   X:(R1)+,X1   Y:(R4)+,Y1   ; and repeat that many times
                                          ; X1*Y1+A ---> A, update X1,Y1
```

Example 2:

```
Multiple Bit Shifts
REP #N
ASR   A
                                          ; N is the number of right shifts
```

Example 3:

```
Memory to Memory Block Move

REP #N
MOVE  X:(R0)+,A      A, Y:(R4)+ ;         ; N is the size of the block moved.
```

• One I_{cyc} for each 24 bit Transfer

NCD02-0562

CHARACTERISTICS OF THE REP INSTRUCTION

- Only single word instructions are repeatable.
- REP and the following instruction are fetched once and stored internally.
- REP is NOT Interruptable!
- LC = 0 specifies the maximum repetition of 65,536 times.
- If LC = SSH, then SSH is read and the SP is postdecremented.
- For dynamic LC sources that are greater than 16 bits, use the appropriate 16 bit destination transfer rules. i.e. Scaling, Limiting, Truncation
- REP cannot be the last instruction of a DO loop. i.e. at LA
- The following instructions are NOT Repeatable:

DO
Jcc
JCLR
JMP
JSET
JScc
JSCLR
JSR
JSSET
REP
RTI
RTS
STOP
SWI
WAIT

NCD02-0563

DONE     ........               ;complement remainder if negative
```

Before Execution

After Execution

NCD02-0572

CHARACTERISTICS OF DIVIDE ITERATION

- The 48 bit dividend (destination) must be a positive fraction, sign extended to 56 bits.
- The 24 bit divisor (Source) must be a positive fraction.
- Valid results are obtained only when the operands are interpreted as fractions and $|D| < |S|$.
- Each DIV operation calculates one bit of quotient using a non restoring fractional division algorithm.
- For an N bit quotient, DIV is executed N times ($1 \le N \le 24$) and produces a 48 bit remainder with 48-N bits of precision.
- In DSP, there is not a real need for a general purpose divide, other than dissemination in time. But DSP is a series of summations, delays, and multiplies.

CHANGE

help change

```
---------- CHANGE: Change Register or Memory Value -----------

CHANGE [D0..7] [reg[_block]/addr[_block] (to)[expression] [VERIFY]

 change pc
 Display register values of the default ADM individually starting with
 the program counter and prompt the user for new values.

 change d2 x:$55
 Display ADM 2 x memory location hexadecimal 55 and prompt user for new value.

 change d3,4,7 p:$20 $123456
 Change ADM 3,4, and 7 p memory address hexadecimal 20 to hexadecimal 123456.

 change r0..r7 0 p:$30..$300 0 x:$fffe $55 pc 100
 Change the default ADM registers r0 through r7 to 0, p memory addresses
 hexadecimal 30 through 300 to 0, x memory address hex fffe to hex 55 and
 the program counter to 100 decimal.
```

DISPLAY

```
DISPLAY [D0..7] [ON/OFF/ALL/IO] [reg[_block/_group]/addr[_block]]...

  ----------- Register and Memory Display Modes -----------

    ON  Always display the following registers and memory locations.
    OFF Never display the following registers and memory locations.

  ----------- Examples -----------

  display on
  Enable all registers for display

  display on p:0..20 x:30..40 y:$100
  Display enable p memory address block 0 to 20, x memory address block
  30 to 40 and y memory address hexadecimal 100.

  display off
  display on dsp host sci
  Disable all display, then enable display of the DSP56000 programming model
  registers, the HOST peripheral registers, and the SCI peripheral registers.

  ----------- Register Group Names -----------

    ALL   all registers.
    DSP   all of the DSP56000 programming model registers.
    IO    all peripheral register names.
    HOST  all registers of the Host peripheral interface.
    PORTB all registers of the Port B interface.
    PORTC all registers of the Port C interface.
    SCI   all registers of the SCI peripheral interface.
    SSI   all registers of the SSI peripheral interface.

  display p:0..300
  Immediate display of p memory addresses 0 through 300.

  display all
  Immediate display of all registers plus the enabled memory locations.
```

NCD02-0711

RADIX

```
----------- RADIX: Change Default Number Base -----------

RADIX [B(binary)/D(decimal)/H(hexadecimal)]

 radix
 Display the default radix currently enabled.

 radix h
 Change default radix entry to hexadecimal.  Hexadecimal constant entries
 no longer require a preceding dollar sign ($) , but any decimal constants
 will require a preceding grave accent (`).
```

NCD02-0712

EVALUATE

---------- EVALUATE: Evaluate an Expression ----------

EVALUATE [Dx] [B(binary)/D(decimal)/F(fractional)/H(hexadecimal)] expression

Following is a list of valid operators useable in an expression:

<	less than	&&	logical 'and'
<=	less than or equal to	||	logical 'or'
==	equal to	!	logical 'negate'
>=	greater than or equal to	&	bitwise 'and'
>	greater than	|	bitwise 'or'
!=	not equal to	~	bitwise one's complement
+	addition	^	bitwise 'exclusive or'
-	subtraction	<<	shift left
/	division	>>	shift right

evaluate r0+p:$50
Add the value in r0 register to the value in program memory address hexadecimal 50 and display the result using the default radix.

evaluate h %10101010&p:r0
Calculate the bitwise AND of the program memory address specified by the value in r0 register and the binary value 10101010 and display the result in hexadecimal.

---------- Examples ----------

evaluate 10
Hex:00000A Dec:000010 Fract:0.0000012 Bin:000000000000000000001010

evaluate 0.31415926
Hex:28365F Dec:2635359 Fract:0.3141593 Bin:001010000011011001011111

NCD02-0713

COPY

---------- COPY: Copy a Memory Block ----------

COPY (from) [Dx] addr[_block] (to)[D0..7] addr
copy p:$100..$130 p:$200
Copy the default ADM program memory values located from hexadecimal 100 through hexadecimal 130 to program memory starting at hexadecimal 200.

copy x:0#100 p:0
Copy one hundred memory locations of the default ADM beginning at x memory location 0 to p memory beginning at location 0.

copy d1 p:0..20 d2..5 p:40
Copy ADM 1 p memory locations 0 through 20 to ADMs 2,3,4 and 5 p memory locations 40 through 60.

---------- Examples ----------

display x:0..7 y:$100..$107
X:$0000 000001 000002 000003 000004 000005 000006 000007 000008

copy y:$100..$107 x:0

display x:0#8 y:0#8
X:$0000 000000 03242B 0647D9 096A90 0C8BD3 0FAB27 12C810 000008
Y:$0000 000000 000000 000000 000000 000000 000000 000000 000000

NCD02-0714

FORCE

```
----------- FORCE: Assert Reset or Break on an ADM -----------

FORCE [D0..7] R(hardware reset)|B(Return to monitor)

 force r
 Force a reset on the current default ADM.

 force b
 Force a break on the current default ADM.

 force d1,4,5 b
 Force ADMs 1,4 and 5 to break
```

NCD02-0715

ASSEMBLE

```
----------- ASM: Single Line Assembler ----------

 ASM [Dx] [(beginning at) addr] [assembler_mnemonic]

  asm p:$50
  Start interactive assembler at program memory address 50 (hex) of default ADM.

  asm x:0 move r0,a1
  Assemble single instruction at x memory address 0 of default ADM.

  asm
  Start assembler at current program counter value of default ADM.

  asm d3 p:100
  Start assembler at program memory address 100 (decimal) of ADM 3.

-------------------- Example ------------------

asm p:$40
ADM#0 P:$0040 57F400 123456 = MOVE #$123456,B
ADM#0 P:$0042 5F0000        = MOVE B,Y:0
ADM#0 P:$0043 20003A        = ASL B
ADM#0 P:$0044 20003A        = ASL B
ADM#0 P:$0045 000000        = NOP
ADM#0 P:$0046 FFFFFF        = DC $FFFFFF

  (To terminate assembly, press <esc>
```

NCD02-0716

DISASSEMBLE

```
----------- DISASSEMBLE: Object Code Disassembler -----------
DISASSEMBLE [D0..7] [addr[_block]]

 disassemble
 Disassemble 19 instructions starting at the current program counter value.

 disassemble y:5
 Disassemble 19 instructions starting at address map y:5.

 disassemble p:0..20
 Disassemble program memory address block 0 to 20.

 disassemble x:$50#10
 Disassemble 10 instructions starting at x memory map hex 50.

-------------------------- Example --------------------------

disassemble p:$40#5
ADM#0 P:$0040 57F400 123456 = MOVE #>$123456,B
ADM#0 P:$0042 5F0000        = MOVE B,Y:<$0
ADM#0 P:$0043 20003A        = ASL B
ADM#0 P:$0044 20003A        = ASL B
ADM#0 P:$0045 000000        = NOP
```

NCD02-0717

TRACE

```
----------- TRACE: Trace Through DSP56000 Program -----------

TRACE [D0..7] [count]

 trace
 Execute one instruction and display the enabled registers and memory
 blocks.

 trace 20
 Execute 20 instructions and display the enabled registers and memory
 blocks after each instruction.

 trace d2,4 5
 Execute 5 instructions on ADMs 2 and 4 from their current program counter
 and display their enabled registers and memory blocks after each instruction.

 -------------------------- Example --------------------------

 display
    b2=    33    b1=444444    b0=555555
 Y:$0000 FFFFFF
 ADM#0 P:$0040 57F400 123456 = MOVE #>$123456,B

 trace 2
 ADM#0 TRACE COUNT=1
    b2=    00    b1=123456    b0=000000
 Y:$0000 FFFFFF
 ADM#0 P:$0042 5F0000        = MOVE B,Y:<$0

 ADM#0 TRACE COUNT=0
    b2=    00    b1=123456    b0=000000
 Y:$0000 123456
 ADM#0 P:$0043 000000        = NOP
```

NCD02-0718

STEP

```
----------- STEP: Step Through DSP56000 Program -----------

STEP [D0..7] [count]

 step
 Step one instruction and display the enabled registers and memory blocks.

 step $50
 Execute hex 50 instructions and display the enabled registers and memory
 blocks at the end of the hex 50th instruction.

 step d1..4 10
 Execute 10 instructions on ADMs 1,2,3 and 4 siumultaneously and
 display the enabled registers and memory blocks of each when they have
 each completed their 10 instructions.
```

NCD02-0719

GO

```
----------- GO: Execute DSP56000 Program -----------

 GO [D0..7] [(from)addr/R(reset)] [(to break #)#bn] [(occurrence):count]

  go
  Start DSP56000 program execution from the current program counter value
  of the default ADM.

  go $100
  Load the default ADM program counter with hexidecimal 100 and start
  DSP56000 program execution.

  go p:$100
  Load the default ADM program counter with the value in program memory
  address hexidecimal 100 and start DSP56000 program execution.

  go r
  Start DSP56000 program execution of the default ADM by asserting
  its reset line.

  go d1..3
  Start DSP56000 program execution of ADMs 1,2 and 3 at their current
  program counter addresses.

  go d1 100 #5 :3
  Start DSP56000 program execution of ADM 1 from address P:100.  Halt on
  the third occurrence of breakpoint number 5.
```

NCD02-0720

BREAK POINT

```
BREAK [D0..7] [#bn] [addr|OFF] T[expr] [H(halt)/In(inc. CNTn)/N(note)/S(show)]
```

Following is a list of valid operators useable in an expression:

<	less than	&&	logical 'and'
<=	less than or equal to	||	logical 'or'
==	equal to	!	logical 'negate'
>=	greater than or equal to	&	bitwise 'and'
>	greater than	|	bitwise 'or'
!=	not equal to	~	bitwise one's complement
+	addition	^	bitwise 'exclusive or'
-	subtraction	<<	shift left
/	division	>>	shift right

---------- Breakpoint Actions ----------

H	Halt execution. This is the default.
In	Increment counter variable CNTn (n=1/2/3/4).
N	Note - display the breakpoint expression and continue.
S	Show the enabled register/memory set and continue.

---------- Examples ----------

```
break
```
Display all currently enabled breakpoints.

```
break off
```
Disable all currently enabled breakpoints.

```
break #1 off
```
Remove breakpoint number 1.

```
break p:500
```
The default ADM will halt program execution when the program counter reaches the instruction at address 500.

```
break p:300 t(lc<10)&&(r0>100)
```
The default ADM will test the conditions of the expression when the program counter reaches the instruction at address 300. If the condition is true the ADM will halt program execution and display its registers.

NCD02-0721

DSP56000 PROCESSING STATES

- Normal
  - Instruction Execution
- Reset – Level Sensitive
  - Assertion of $\overline{\text{RESET}}$ Pin.
- Wait
  - Halt the processor core.
  - Clock and peripherals are active.
- Stop
  - Halt everything!
- Exception – Three levels of Software programmable priority
  - External Interrupts
    - IRQA – Level Sensitive or Edge Sensitive
    - IRQB – Level Sensitive or Edge Sensitive
  - Internal
    - Software Interrupt
    - On Chip Peripheral
    - Error Condition
    - Tracing

NCD02-0601

VECTOR TABLE OF EXCEPTION SOURCES

Exception Starting Address	Program Memory Space: Exception Source	
$0000	Hardware $\overline{\text{RESET}}$	Two Words Per Vector
$0002	Stack Error	
$0004	Trace	
$0006	SWI (Software Interrupt)	External Interrupts
$0008	$\overline{\text{IRQA}}$ External Hardware Interrupt	
$000A	$\overline{\text{IRQB}}$ External Hardware Interrupt	
$000C	SSI Receive Data	Synchronous Serial Interface
$000E	SSI Receive Data with Exception Status	
$0010	SSI Transmit Data	
$0012	SSI Transmit Data with Exception Status	Internal Interrupts
$0014	SCI Receive Data	Synchronous Communications Interface
$0016	SCI Receive Data with Exception Status	
$0018	SCI Transmit Data	
$001A	SCI Idle Line	
$001C	SCI Timer	
$001E	Reserved for Hardware Development	
$0020	Host Receive Data	Host Interface
$0022	Host Transmit Data	
$0024	Host Command (Default)	Internal Interrupts
$0026	Available for Host Command

$003A	Available for Host Command	
$003C	Available for Host Command	
$003E	Available for Host Command	

- The Vector table contains Instructions, NOT Addresses!

- Each Vector location can contain;
  - Two, One Word Instructions
  - One, Two Word Instruction

NCD02-0602

RESET

Assertion of $\overline{\text{RESET}}$

1. Reset on chip peripherals.

RESET → Port B & C, SCI, SSI, HOST

2. Set Modifier Registers to $FFFF.

M0 – M7 $FFFF

3. Clear Interrupt Priority Register.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
X:$FFFF	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	SCI		SSI		HOST		RESERVED				IRQB			IRQA		

4. Set Bus Control Register to $FFFF.

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
X:$FFFE	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
	X Memory				Y Memory				P Memory				Peripherals			

5. Clear the Stack Pointer.

5	4	3	2	1	0
0	0	0	0	0	0
UF	SE	P3	P2	P1	P0

6. Initialize Status Register.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	1	1	0	0	E	U	N	Z	V	C
LF		T		S1	S0	I1	I0		L						

7. Clear the Data ROM Enable Bit and the Memory Ready Enable list in the OMR Register.

8. Stay in RESET until negated.

Negation of $\overline{\text{RESET}}$

MODB MODA

0	0	0	0	0	0	X	X
ME					DE		

9. Load Operating Mode Register from Mode Pins.

10. Start normal execution:
    If Mode 2 P:$E000
    Else P: $0000

JMP START

NCD02-0603

STACK ERROR

- A transition of the Stack Error bit from 0 to 1 causes a Stack Error Exception.
- DO Loops are sources of Double pulls and double pushes.

NCD02-0604

CHARACTERISTICS OF STACK ERROR

- The Stack Error Vector occupies address P:$0002 and P:$0003

- Occurs on Stack Overflow or Underflow.
- Stack Error Bit (SE) changing from 0 to 1 creates a non maskable level 3, (Highest Priority), Stack Error Exception.
- A Stack Error Exception does NOT occur when:
  - The Stack is empty (SP= 0) and an instruction reads the stack without postdecrementing the SP
  - The Stack is empty and overflowed (SP=$10) and an instruction writes the stack without preincrementing the SP.
  - Both conditions create an unsuccessful read or write because it is a non existing stack location.

Examples: a) DO SSL, xxxx

b) REP SSL

c) MOVEC SSL, xxxx

d) MOVEP xxxx, SSL

NCD02-0605

WAIT EXCEPTION

Entering Wait State

- On-chip Clock oscillator and peripherals remain active
- Low Power Stand by mode
- Machine state is maintained, all on chip RAM, Processor and Peripheral Registers
- Exit WAIT processing state via any interrupt.

NCD02-0606-1

EXITING WAIT STATE

- RESET – Begin Reset Processing
- Any Unmasked Internal or External Hardware Interrupt.

NCD02-0607

STOP EXCEPTION

Entering Stop State

- Entire DSP56000 is halted: Processor, Oscillator and Peripherals
- Lowest power saving stand by mode
- Machine State is maintained, all on chip RAM, Processor and Peripheral registers.
- Exit STOP processing state via two methods

NCD02-0608-1

EXITING STOP STATE VIA RESET

1. Enables Clock and Peripherals.
2. Starts RESET Exception Processing.

NCD02-0609

EXITING STOP STATE VIA IRQA

Case I: Interrupt Pending

Service the Highest Pending Interrupt.

NOTE: $\overline{\text{IRQA}}$ does not need to be the pending interrupt. Any pending interrupt will cause exception processing for that interrupt.

Case II: No Interrupt Pending

Begin execution with the instruction that immediately follows the STOP instruction.

NCD02-0611

EXITING STOP STATE VIA IRQA TIMING

Num	Characteristic		Min	Max	Unit
25	Duration for IRQA Assertion to Recover from STOP State		25		ns
26	Delay from IRQA Assertion to Fetch of First Interrupt Instruction	Stable External Clock	128000T + 17T	–	ns
		Internal Crystal Oscillator Clock	150000T	–	ns
27	Duration for Level Sensitive IRQA Assertion to Fetch of First Interrupt Instruction	External Clock	128000T + 17T	–	ns
		Internal Clock	150000T	–	ns
28	Delay from Level Sensitive IRQA Assertion to Fetch of First Interrupt Instruction	External Clock	128000T + 17T	–	ns
		Internal Clock	150000T	–	ns

NCD02-0610-2

WAIT VS. STOP

- Useful for low power or battery powered applications
- Trade off is power dissipation vs. recovery time

Processing State	Current Consumption (TYP) @ 20 MHz	Recovery From Exception
NORMAL	90 mA	16T – 18T
WAIT	30 mA	20T
STOP	100 µA	128,000T–150,000T

NCD02-0612

PROGRAM DEBUGGING USING TRACE MODE

ENTERING TRACE MODE

TRACING

NCD02-0615

CHARACTERISTICS OF TRACE

- Useful for debugging.
- Traps out to Trace Exception Vector after execution of each instruction.
- Trace is a NON Maskable level 3 exception.
- Masks out all external and Peripheral Interrupts except for TRACE, STACK ERROR, and RESET.
- Fast Interrupt routines cannot be traced.

NCD02-0631

FAST INTERRUPT

- A Zero Overhead Interrupt

NCD02-0616

CHARACTERISTICS OF FAST INTERRUPTS

- Fast interrupts consist of a single two word instruction, or two, one word instructions.
- Any exception source can be a Fast interrupt except RESET.
- The Program Counter is never updated to the interrupt routine
- Normal Instruction fetching resumes using the Program Counter following the completion of the Fast Interrupt Routine.
- It is NOT interruptable, even by an interrupt of a higher priority.
- Status is NOT preserved. Caution should be taken when using instructions which modify the Status Register.
- They cannot be traced.
- The scaling mode in effect before the fast interrupt, apply to the fast interrupt.
- A Fast interrupt MUST NOT use a "Change of Flow" instruction.
- A jump to subroutine instruction within the fast interrupt routine constitutes a Long Interrupt Routine.

NCD02-0617

LONG INTERRUPT

• Traditional Interrupt

NCD02-0618

CHARACTERISTICS OF LONG INTERRUPTS

- Entered when a "Change of Program Flow" instruction is used in the Exception Vector Table. i.e. JSR.
- Program Counter is updated to the Return Address.
- Interrupt Service Routine is terminated with a RTI.

NCD02-0632

RTI – RETURN FROM INTERRUPT

Execute RTI Instruction

1. Restore Program Counter
2. Restore Status Register
   - Loop Flag
   - Trace Bit
   - Scaling Mode Bits
   - Interrupt Level
   - Condition Code
3. Decrement Stack Pointer

NCD02-0620

INTERRUPT INSTRUCTION TIMING

Fast Interrupt

Minimum Interrupt Cycle Time

INSTRUCTION CYCLE	1	2	3	4	5	6	7	8	9	10
FETCH	N3	N4	IV1	IV2	N5	N6	N7	N8	N9	N10
DECODE	N2	N3	N4	IV1	IV2	N5	N6	N7	N8	N9
EXECUTE	N1	N2	N3	N4	IV1	IV2	N5	N6	N7	N8

Nn - Normal Instruction Word
IVn - Interrupt Vector Word (NO Change of Flow)

Long Interrupt

Minimum Interrupt Cycle Time

INSTRUCTION CYCLE	1	2	3	4	5	6	7	8	9	10
FETCH	N3	N4	IV1	IV2	I1	I2	I3	N5	N6	N7
DECODE	N2	N3	N4	JSR	ISR	I1	RTI	X	N5	N6
EXECUTE	N1	N2	N3	N4	JSR	ISR	I1	RTI	X	N5

Nn - Normal Instruction Word
IVn - Interrupt Vector Word (Change of Flow)
JSR - Jump to Interrupt Service Routine Instruction
I1 - Interrupt Service Routine Instruction(s)
RTI - Return from Interrupt Instruction
X - RTI Execution Time

NCD02-0621

LEVEL SENSITIVE FAST INTERRUPTS

Num	Characteristic		Min	Max	Unit
17	Delay from $\overline{IRQA}$, $\overline{IRQB}$ Assertion to External Memory Access Address Out Valid Caused by First Interrupt Instruction Fetch		19T	–	ns
19	Delay from Address Output Valid Caused by First Interrupt Instruction Fetch to Interrupt Request Deassertion for Level Sensitive Fast Interrupts		–	5T – 2T•WS – 44	ns
20	Delay from $\overline{RD}$ Assertion to Interrupt Request Deassertion for Level Sensitive Fast Interrupts		–	4T – 2T•WS – 40	ns
21	Delay from $\overline{WR}$ Assertion to Interrupt Request Deassertion for Level Sensitive Fast Interrupts	WS = 0 WS· 0	– –	4T – 40 3T – 2T•WS – 40	ns ns

NCD02-0622

NEGATIVE EDGE TRIGGERED INTERRUPT

Fast or Long Interrupt

- Latched as pending on the first High to Low transition.
- Cleared automatically when interrupt is serviced or by hardware RESET.

Recommendations for easy Interrupt Implementation

- Use Edge triggered for Fast Interrupts
  - Faster Response
  - Timing is easier to meet
- Use Level Sensitive for Long Interrupts
  - Multiple devices can be Wire-ORed together

NCD02-0623

INTERRUPT EXAMPLES

Vector Table

Negative edge triggered FAST Interrupt

Level Sensitive LONG Interrupt

Internal FAST Interrupt
NOTE: Changes Condition Codes

Internal LONG Interrupt

Internal FAST Interrupt
NOTE: Long Response, Uninterruptable for (N + 2) I_{cyc}

FAST or LONG?

NCD02-0624-1

LONG SOFTWARE INTERRUPT

NCD02-0625

FAST SOFTWARE INTERRUPT

Characteristics of Software Interrupts

- SWI is Non Maskable and is serviced immediately after execution of the SWI instruction.
- SWI sets the Interrupt Priority to level 3.
- Useful for System Calls to Executive Routines or Debugging Interrupt Routines.

NCD02-0626

INTERRUPT PRIORITY LEVEL MASK BITS

Priority	I1	I0	Exceptions Permitted	Exceptions Masked
Low	0	0	IPL 0, 1, 2, 3	None
↓	0	1	IPL 1, 2, 3	IPL 0
	1	0	IPL 2, 3	IPL 0, 1
High	1	1	IPL 3	IPL 0, 1, 2

- Four Levels of Prioritized Interrupts
- Set to Highest Level on Hardware or Software RESET

NCD02-0627

INTERRUPT PRIORITY SYSTEM

INTERRUPT PRIORITY REGISTER

	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
X:$FFFF	SCL1	SCL0	SSL1	SSL0	HPL1	HPL0	0	0	0	0	IBL2	IBL1	IBL0	IAL2	IAL1	IAL0
	SCI IPL		SSI IPL		Host IPL		RESERVED				IRQB Mode			IRQA Mode		

Interrupt Priority Level Bits

Priority	xxL1	xxL0	Enabled	Interrupt Priority Level (IPL)
Low	0	0	No	Masked
↓	0	1	Yes	0
	1	0	Yes	1
High	1	1	Yes	2

External Interrupt Trigger Mode Bits

IAL2 or IBL2	Trigger Mode
0	Level
1	Negative Edge

- On Hardware or Software RESET, the Interrupt Priority Register is Cleared i.e. All Interrupts are Masked.

External Interrupts are Level Sensitive.

NCD02-0629

EXCEPTION PRIORITIES WITHIN AN IPL

Priority	Exception	Enabled by	Interrupt Priority Levels
Highest	Hardware $\overline{\text{RESET}}$	Non Maskable	3
↑	Stack Error	Non Maskable	3

	SCI Idle Line Interrupt	ILIE	
Lowest	SCI Timer Interrupt	TMIE	

NCD02-0630

DSP56000/1
ON CHIP PERIPHERALS

Objectives:

- Describe how to perform Parallel I/O.
- Describe how to transmit and receive a character using the Serial Communications Interface.
- Describe the Host Interface and Host Transfers.
- Describe a Synchronous Serial Interface application.
- Describe the function of the SSI registers plus the control and status bits.

ON CHIP PERIPHERAL FEATURES

- 24 Separate Input/Output Pins
- Software Programmable as General Purpose Parallel I/O or Alternate Peripheral Function.
  - HOST Interface
  - Serial Communications Interface (SCI)
  - Synchronous Serial Interface (SSI)
- All Peripherals are Memory Mapped so Standard MOVE Instructions can be used.
- Special MOVEP Instruction for full I/O service capability.
- I/O Short Addressing provides shorter, faster instructions.
- All Control Ports and Data Registers are Read/Write so Standard Bit Manipulation Instructions can be used.
- Bit Addressing Instruction provide useful I/O Service Routines: BCHG, BCLR, BSET, BTST, JCLR, JSCLR, JSET, JSSET
- Separate Interrupt Vectors for each Interrupt Source.
- Four Interrupt Priority Levels.
- Either Fast or Long Interrupts may be used.

Bytes Are Masked On The Fly

- STX is the same register decoded at three different addresses. (Same for SRX)

NCD02-1040

SCI RESET

1. Perform Hardware or Software RESET
2. Program SCI Control Registers
3. Configure at least one Port C Control bit as SCI Serial Interface.

Parallel Port C

X:$FFE1 PORT C Control Register (PCC)

CCx	Function
0	Parallel I/O
1	Serial Interface

4. SCI is now active.

Characteristics of SCI RESET

- At any time during program execution, the SCI may be put in the RESET state by clearing CC2, CC1, and CC0.
- All status bits of the SCI interface will be put to their RESET condition state.
- The contents of the SCI interface control and clock control registers are not affected.
- This permits separate resetting of the SCI.

NCD02-1045-1

SCI SYNCHRONOUS SLAVE TIMING (EXTERNAL CLOCK)

Num.	Characteristic	Min	Max	Unit
55	Synchronous Clock Cycle (see Note 1)	16T	–	ns
56	Clock Low Period	16T/2-20	–	ns
57	Clock High Period	16T/2-20	–	ns
63	Clock Falling Edge to Output Data Valid (External Clock)	–	63	ns
64	Output Data Hold After Clock Rising Edge (External Clock)	2T + 12	–	ns
65	Input Data Setup Time Before Clock Rising Edge (External Clock)	30	–	ns
66	Input Data Hold Time After Clock Rising Edge (External Clock)	40	–	ns

NOTE:
1. Synchronous clock cycle, t_{SCC}, (for internal clock) is determined by the SCI clock control register and I_{cyc}.

NCD02-1046

CHARACTERISTICS OF SCI SYNCHRONOUS MODE

- Common clock to both Transmit and Receive shift registers

- As a controller:
  - Synchronous Master
  - TCM = RCM = 0
  - SCLK is an output
  - Outputs a clock when data is present
  - Transmitted data is stable during both the falling and rising clock edge
  - Received data is sampled in the middle of the clock low time

- As a peripheral:
  - Synchronous Slave
  - TCM = RCM = 1
  - SCLK is an input
  - Data is clocked out on the falling edge of SCLK
  - Data is clocked in on the rising edge of SCLK

- WARNING: TCM ≠ RCM is not permitted in the synchronous mode, and the results are undefined.

NCD02-1047

SCI RECEIVER INITIALIZATION

1. Hardware or Software RESET
2. Program SCR with desired mode and features.
3. Turn on Receiver (RE = 1).
4. Optionally Enable Receiver Interrupts. (RIE = 1).

X:$FFF0 - SCI Interface Control Register (SCR) (Read/Write)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	TMIE	TIE	1	ILIE	TE	1	WOMS	RWU	WAKE	SBK	0	WDS2	WDS1	WDS0

RIE — Receiver Interrupt Enable

RE — Receiver Enable

5. Set the RXD bit in PCC to enable the SCI Receiver System.

X:$FFE1 PORT C Control Register (PCC)

23							16	15							8	7							0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	CC 8	CC 7	CC 6	CC 5	CC 4	CC 3	CC 2	CC 1	1

← SCI →

CCx	Function
0	Parallel I/O
1	Serial Interface

RXD — Receive Data Pin Enable

- If RE is cleared while a valid character is being received, the reception of the character will be completed before the receiver is disabled.

NCD02-1048

SCI RECEIVE A CHARACTER

1. The receiver is idle until a character is received in the Data Shift Register.

2. Transferring the received Character into SRX sets RDRF in the SSR.

X:$FFF1 - SCI Interface Status Register (SSR) (Read Only)

7	6	5	4	3	2	1	0
R8	FE	PE	OR	IDLE	1	TDRE	TNRE

RDRF

3. If RIE =1 in SCR, then an interrupt is generated

5. Reading SRX clears RDRF in the SSR.

4. The Receive Interrupt Service Routine reads the received character.

NCD02-1049

SCI - RECEIVE A CHARACTER WITH EXCEPTION

1. A character is received with at least one of the following errors:

   - Framing Error (FE = Bit 6 in SSR)
   - Parity Error (PE = Bit 5 in SSR)
   - Overrun Error (OR = Bit 4 in SSR)

2. This sets RDRF and FE, PE, or OR in SSR.

3. SSR can be polled by software

4. If RIE = 1 in SCR, then an interrupt is generated

5. Read SSR, followed by

6. Reading SRX. This clears RDRF in the SSR and clears the FE, PE, and OR flags.

NCD02-1050

SCI TRANSMITTER INITIALIZATION

1. Hardware or Software RESET
2. Program SCR with Desired Mode and Features.
3. Turn on Transmitter (TE = 1)
4. Optionally Enable Transmitter Interrupts. (TIE = 1).

X:$FFF0-SCI Interface Control Register (SCR)(Read/Write)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	TMIE	1	RIE	ILIE	1	RE	WOMS	RWU	WAKE	SBK	0	WDS2	WDS1	WDS0

TIE — Transmit Interrupt Enable

TE — Transmitter Enable

5. Set the TXD Bit in PCC to Enable the SCI Transmitter System.

X:$FFE1 Port C Control Register (PCC)

23							16	15						8	7						0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	CC 8	CC 7	CC 6	CC 5	CC 4	CC 3	CC 2	1	CC 0

← SCI →

CCx	FUNCTION
0	PARALLEL I/O
1	SERIAL INTERFACE

TXD — Transmit Data Pin Enable

6. The transmitter will first broadcast a preamble of ones before beginning data transmission
   10 ones will be transmitted for the 10 bit asynchronous mode
   11 ones will be transmitted for the 11 bit asynchronous mode

• If TE is cleared while transmitting a character, the transmission of the character will be completed before the transmitter is disabled.

NCD02-1051

SCI TRANSMIT A CHARACTER

X:$FFF1 - SCI Interface Status Register (SSR)(Read Only)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	R8	FE	PE	OR	IDLE	RDRF	1	1

TDRE — Transmit Data Register Empty

TRNE — Transmitter Empty

1. When STX is empty, then TDRE = 1
2. When STX is empty and the Transmit Data Shift Register is empty then TRNE = 1
3. If TIE = 1 in SCR and TDRE = 1 in SSR, then an interrupt is generated.

6. The character in STX is copied into transmit data shift register.
   TRNE is cleared
   TDRE is set
   Go to Step 3.

NCD02-1052

TRANSMITTING MARKS AND SPACES

X:$FFF0 - SCI Interface Control Register (SCR)(Read/Write)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	TMIE	TIE	RIE	ILIE	TE	RE	WOMS	RWU	WAKE	SBK	0	WDS2	WDS1	WDS0

Toggle (1-0-1) to send a character time of all ones (marks)

Toggle (0-1-0) to send a character time of all zeros (spaces)

- 10 or 11 ones/zeros will be sent depending on the word length specified by WDS2, WDS1, WDS0.

Marks (Ones)

1. Write the last byte to STX
2. Wait for TDRE = 1. The last byte is now in the transmit shift register
3. Clear TE and set back to one. This queues the preamble to follow the last byte
4. Write the first byte to follow the preamble into SRX

SPACES (ZEROS)

A stop bit at the end of the break will be inserted before the next character starts

SCI - CLOCK AND TIMER

COMMON BAUD RATES

BAUD Rate	After Prescaler	SCP Bit	After 12 Bit Divider	Divider Bits CD0 - CD11	Fosc
350000	11,200,000	0	11,200,000	1	20,500,000
9600	307,200	0	307,200	33	20,275,200
4800	153,600	0	153,600	66	20,275,200

NCD02-1055

SCI ASYNCHRONOUS MODE TIMING

NOTE: In the wire-OR mode TXD can be pulled up by 1 kΩ.

Num.	Characteristic	Min	Max	Unit
67	Asynchronous Clock Cycle (see Note 2)	128T	–	ns
68	Clock Low Period	t_{ACC} / 2 - 20	–	ns
69	Clock High Period	t_{ACC} / 2 - 20	–	ns
70	Output Clock Rise/Fall Time	–	20	ns
71	Output Data Setup to Clock Rising Edge (Internal Clock)	t_{ACC} / 2 - 100	–	ns
72	Output Data Hold After Clock Rising Edge (Internal Clock)	t_{ACC} / 2 - 100	–	ns

NOTE:
2. Asynchronous clock cycle, t_{ACC} (for internal clock) is determined by the SCI clock control register and I_{cyc}.

NCD02-1056

11 BIT MULTIDROP MODE

TRANSMITTING DATA AND ADDRESS CHARACTERS

WIRED-OR MODE

IDLE LINE WAKE UP

X:$FFF0 - SCI Interface Control Register (SCR) (Read/Write)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	TMIE	TIE	1	1	TE	RE	WOMS	1	0	SBK	0	WDS2	WDS1	WDS0

RIE — Receive Interrupt Enable

ILIE — Idle Line Interrupt Enable

RWU — Receiver Wake-up Enable

WAKE — Idle Line Wake-up

Line is idle for 10 or 11 Stop Bits

1. RWU is cleared. The receiver is enabled.
2. IDLE is set in SSR indicating the line is idle.
3. An internal flag SRIINT is generated for once each idle state, no matter how long it lasts.

7	6	5	4	3	2	1	0
R8	FE	PE	OR	1	RDRF	TDRE	TNRE

IDLE (SRIINT)

4. If ILIE = 1 in SCR, then an SCI Idle Line Interrupt is pending.

5. When IDLE line interrupt is serviced then SRIINT is automatically cleared.

NCD02-1060

ADDRESS MODE WAKE UP

X:$FFF0 - SCI Interface Control Register (SCR) (Read/Write)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	TMIE	TIE	1	ILIE	TE	RE	WOMS	1	1	SBK	0	WDS2	WDS1	WDS0

RIE — Receive Interrupt Enable

RWU — Receiver Wake-up Enable

WAKE — Address Wake-up

1. When Address Character is received, then R8 = 1 in SSR and RWU is cleared. The Receiver "Wakes Up".

X:$FFF1 - SCI Interface Status Register (SSR) (Read Only)

1	FE	PE	OR	1	RDRF	TDRE	TDRE

R8

2. If RIE = 1 in SCR, then an SCI Receive Data Interrupt is Processed

NCD02-1061

HOST INTERFACE FEATURES

- Allows the DSP56000 to be a memory mapped peripheral to
  - All popular microprocessors
  - Direct memory access controllers
  - Other computer systems
- Mixed 8, 16, and 24-bit transfers.
- Appears as eight locations of byte wide memory
- Fifteen pin interface
- 10.25 Megabytes per second transfer rate (Max.)
  - 8 Megabyte per second burst data transfer rate
  - 1.67 Megabyte per second interrupt driven data transfer rate
- Three types of HOST transfers
  - HOST to DSP56000
  - DSP56000 to HOST
  - HOST command
- Three types of HOST handshaking protocols:
  - Software polled
  - Interrupt driven (Fast or Long)
  - Direct memory access
- HOST interrupt has M68000 family compatible interrupt acknowledge vector.

$1 Command Vector Register (CVR)

7			0
0	0	0	Host Vector (HV)

HC – Host Command (Status)

NCD02-1017

HOST COMMAND PROGRAMMING

Characteristics of the Host Command

- Writing the HC bit and HV can be done simultaneously in one step
- The Host processor can clear the HC bit to cancel a Host Command at anytime before the DSP56000 exception is recognized.
- The HC bit is cleared by the DSP hardware upon exception recognition and can be read as a status bit.
- To guarantee a stable interrupt vector, write HV only when HC is clear.
- Upon RESET, HV = $12, Exception Vector P:$0024.
- The HV may be programmed to any exception vector.
- It is not recommended that HV = 0 (RESET) be used because it does not reset the DSP hardware.

NCD02-1018-1

HOST FLAGS

Host to DSP56000 Status Flags

Characteristics of Host Flags

- When reading Host Flags as an encoded pair, a small probability exists that they may be read while in transition.

There are two solutions to guarantee stability:

1. Read the bits twice and check for consensus
2. Assert $\overline{HEN}$ for 2T + 60nS for the Host interface logic to properly latch the bits.

NCD02-1019

BOOTSTRAP USING HOST FLAGS

Host

	7			4	3			0

41	HR/W High Setup Time to HEN Assertion		0	–	ns
42	HR/W High Hold Time After HEN/HACK Deassertion		5	–	ns

Characteristics of the HOST Exception

- Interrupt Vector Register may be programmed to any value from 0 to 255.
- On RESET it is set to $0F. This corresponds to the Uninitialized Exception Vector in the M68000 family.
- To use the HOST Exception, the DMA mode must be disabled.

NCD02-1029-1

HOST INTERFACE DMA MODE

Characteristics of Host DMA Mode

- The HREQ pin is NOT available for Host Processor Interrupts
- TREQ and RREQ select the direction of DMA transfer
  - DMA to DSP56000
  - DSP56000 to DMA
  - Simultaneous Bidirectional DMA transfers are not permitted
- Host processor software polled transfers are permitted in the opposite direction of the DMA transfer
- 8, 16, or 24 bit transfers are supported.
  - 16 or 24 bit transfers reduce the DSP interrupt rate by a factor of 2 or 3 respectively.

NCD02-1030

DMA TRANSFER AND HOST INTERRUPTS

Fast Interrupt Routine

```
P:$0020  MOVE X:$FFE8, A   ; READ HRX
P:$0021  MOVE A, Y:(R7)+   ;AND PUT INTO Y MEMORY
```

NCD02-1031

HOST MODE BITS WITH TREQ AND RREQ

Interrupt Control Register (ICR)
(Read/Write)

	7	Modes						0
$0	INIT	HM1	HM0	HF1	HF0	0	TREQ	RREQ

HM1	HM0	Mode
0	0	Interrupt Mode (DMA off) ← RESET Condition
0	1	DMA mode – 24 bit
1	0	DMA mode – 16 bit
1	1	DMA mode – 8 bit

Interrupt Mode (DMA off)

TREQ	RREQ	$\overline{\text{HREQ}}$ Pin
0	0	No interrupts (Polling)
0	1	RXDF Request (interrupt)
1	0	TXDE Request (interrupt)
1	1	RXDF and TXDE Request (interrupts)

DMA Mode

TREQ	RREQ	$\overline{\text{HREQ}}$ Pin
0	0	No DMA
0	1	DSP → HOST Request (RX)
1	0	HOST → DSP Request (TX)
1	1	Undefined (illegal)

	7							0	
$2	HREQ	DMA	0	HF3	HF2	TRDY	TXDE	RXDF	**Interrupt Status Register (ISR) (Read Only)**

	7							0	
X:$FFE9	DMA	0	0	HF1	HF0	HCP	HTDE	HRDF	**Host Status Register (HSR) (Read Only)**

NCD02-1032

HOST MODE AND INITIALIZE BITS

Interrupt Control Register (ICR)
(Read/Write)

Host sets INIT bit 1 →

7	Modes						0
INIT	HM1	HM0	HF1	HF0	0	TREQ	RREQ

HM1	HM0	Mode
0	0	Interrupt Mode (DMA off) ← RESET Condition
0	1	DMA mode – 24 bit
1	0	DMA mode – 16 bit
1	1	DMA mode – 8 bit

Interrupt Mode (DMA off)

TRBQ	RREQ	INIT Execution
0	0	INIT=0; "address counter=00"
0	1	INIT=0; RXDF=0; HTDE=1; "address counter=00"
1	0	INIT=0; TXDE=1; HRDF=0; "address counter=00"
1	1	INIT=0; RXDF=0; HTDE=1; TXDE=1; HRDF=0; "address counter=00"

DMA Mode

TRBQ	RREQ	INIT Execution
0	0	INIT=0; address counter=HM1, HM0
0	1	INIT=0; RXDF=0; HTDE=1; address counter=HM1,HM0
1	0	INIT=0; TXDE=1; HRDF=0; address counter=HM1,HM0
1	1	Undefined (illegal)

- INIT is used by the HOST to force Initialization of the Host Interface hardware
- The Host Interface hardware automatically clears INIT when the command is complete
- INIT is cleared by DSP RESET.

NCD02-1033

HOST TO DSP56000 DMA PROCEDURE

NCD02-1034-1

HOST DMA WRITE CYCLE TIMING

Num.	Characteristic		Min	Max	Unit
31	$\overline{HEN}/\overline{HACK}$ Assertion Width (see note 2)	Read	50	–	ns
		Write	25	–	ns
32	$\overline{HEN}$, $\overline{HACK}$ Deassertion Width (see note 2)		25	–	ns
33	Host Data Input Setup Time Before $\overline{HEN}$, $\overline{HACK}$ Deassertion		5	–	ns
34	Host Data Input Setup Time Before $\overline{HEN}/\overline{HACK}$ Deassertion		5	–	ns
45	DMA $\overline{HACK}$ Assertion to $\overline{HREQ}$ Deassertion (see note 3)		5	60	ns
46	DMA $\overline{HACK}$ Deassertion to $\overline{HREQ}$ Assertion (see note 3)	for DMA RXL Read	t_{HSDL} + 3T + 5	–	ns
		for DMA TXL Write	t_{HSDL} + 2T + 5	–	
		for All Other Cases	5	–	

NOTES:

1. "Host synchronous delay(t_{HDSL})" is the time required for the DSP56000/56001 to sample any external asynchronous input signal, determine whether it is high or low, and synchronize it to the DSP56000/56001 internal clock.

2. See HOST PORT USAGE CONSIDERATIONS.

3. $\overline{HREQ}$ is pulled up by 1 kΩ.

NCD02-1035

DSP56000 TO HOST DMA PROCEDURE

Host Processor | **DMA Controller** | **DSP56000**

1. Program DMA Controller →
   - Start Address
   - Byte Count
   - Transfer Direction
   - Start DMA Channel

2. Initialize DSP56000 Host Interface — Write ICR →
   - Mode 24 Bit DMA
   - DSP → Host
   - Use INIT Bit to:
     - Set RXDF
     - Clear HTDE
     - Load DMA Counter

$0 Interrupt Control Register (ICR)

7							0
1	0	1	HF1	HF0	0	0	1
INIT	HM1	HM0				TREQ	RREQ

3. Tell DSP56000 →
   - Source pointer address
   - Enable HTIE

   This can be done with a Host Command

X:$FFE8 Host Control REgister (HCR)

7							0
0	0	0	HF3	HF2	HCIE	1	HRIE
						HTIE	

4. Assert $\overline{HREQ}$ to start DMA Transfer

5. Host is free to perform other tasks.
   i.e. Host to DSP Transfer on a Polled Basis

6. DMA Controller performs reads.

7. DMA Controller interrupts host when transfers are done.

8. Terminate DMA Channel

9. Terminate DSP DMA mode by clearing HM1, HM0, and TREQ.

NCD02-1036-2

HOST DMA READ CYCLE TIMING

Num.	Characteristic		Min	Max	Unit
31	$\overline{HEN}$, $\overline{HACK}$ Assertion Width (see note 2)	Read Write	50 25	– –	ns
32	$\overline{HEN}$/$\overline{HACK}$ Deassertion Width (see note 2)		25	–	ns
35	$\overline{HEN}$/$\overline{HACK}$ Assertion to Output Data Active from High Impedance		0	–	ns
36	$\overline{HEN}$/$\overline{HACK}$ Assertion to Output Data Valid		–	50	ns
37	$\overline{HEN}$/$\overline{HACK}$ Deassertion to Output Data High Impedance		–	35	ns
38	Output Data Hold Time After $\overline{HEN}$/$\overline{HACK}$ Deassertion		5	–	ns
45	DMA $\overline{HACK}$ Assertion to $\overline{HREQ}$ Deassertion (see note 3)		5	60	ns
46	DMA $\overline{HACK}$ Deassertion to $\overline{HREQ}$ Assertion (see note 3)	for DMA RXL Read for DMA TXL Write for All Other Cases	t_{HSDL} + 3T + 5 t_{HSDL} + 2T + 5 5	– – –	ns

NOTES:
2. See HOST PORT USAGE CONSIDERATIONS.
3. $\overline{HREQ}$ is pulled up by 1 kΩ.

NCD02-1037

SYNCHRONOUS SERIAL INTERFACE FEATURES

- 5 Megabit per Second Serial Interface

- 6 Pin Interface

- Interface to a wide variety of Standard Serial Devices
  - CODECS
  - Time Division Multiplexed Networks
  - Serial Peripherals
  - DSP56000 to DSP56000 Networks
  - Motorola SPI Peripherals
  - Economical Shift Registers

- Clock - Continuous, Gated, Internal, External

- Programmable Word Length - 8, 12, 16, or 24 bits

- On Chip Serial Clock and Frame Sync Generator

- Double Buffered, User Programmable, Output and Input, Control and Status Bits.

- Operating Modes - Normal, Network, on-Demand

- Four Interrupt Vectors
  - Receive
  - Receive with Exception
  - Transmit
  - Transmit with Exception

NCD02-1062

SSI OPERATING MODES

Tx,Rx Sections	Serial Clock	Protocol	Typical Applications
Asynchronous	Continuous	Normal	single asynchronous codec stream-mode channel interface
Asynchronous	Gated	Normal	DSP-to DSP serial peripherals (A/D,D/A)
Asynchronous	Continuous	Network	TDM networks
Asynchronous	Gated	On Demand	Parallel to serial and serial to parallel conversion
Synchronous	Continuous	Normal	multiple synchronous codecs
Synchronous	Gated	Normal	SPI-type devices DSP-to-MCU
Synchronous	Continuous	Network	TDM codec network TDM DSP networks
Synchronous	Gated	On Demand	DSP to SPI peripherals

NCD02-1063-1

SSI INITIALIZATION

X:$FFE1 Port C Control Register (PCC)

INITIALIZATION

1. Hardware or Software RESET
2. Program SSI Control Registers
3. Configure at least one SSI PCC Bit as Serial Interface

- Clearing PCC8-PCC3 puts the SSI in the RESET state but does not change the control registers.
- The initialization sequence must be used when changing the following bits MOD, GCK,SYN, SCKD, SCD2, SCD1, SCD0.

NCD02-1064-1

SERIAL CONTROL DIRECTION BITS

X:$FFED - SSI Control Register B (CRB) (Read/Write)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RIE	TIE	RE	TE	MOD	GCK	SYN	FSL	0	0	SCKD	SCD2	SCD1	SCD0	OF1	OF0

1 = Output
0 = Input

Direction Controlled by	Basic Function
SCD0	Receive Clock/Flag 0
SCD1	Receive Frame Sync/Flag 1
SCD2	Transmit Frame Sync /Tx and Rx Frame Sync
SCKD	Transmit Clock/Tx and Rx Clock
—	SSI Receive Data
—	SSI Transmit Data

NCD02-1067

SSI - CONTROL AND STATUS REGISTER SET

SSI TRANSMIT AND RECEIVE REGISTER SET

- Data is sent MSB first.
- Compatible with fractional format.

SYNCHRONOUS COMMUNICATION

- The SSI must transmit and receive simultaneously on word boundaries.
- The Transmit/Receive word transfer rate or "Duty Cycle" is set by programming DC4-DC0
- If the transmitter is not loaded before the next word transfer time then Transmitter Underrun occurs.
- If the receiver is not read before the next word transfer time then Receiver Overrun occurs.

NCD02-1068-1

CLOCK MODES

X:$FFED-SSI Control Register B (CRB) (Read/Write)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RIE	TIE	RE	TE	MOD	GCK *	SYN	FSL	0	0	SCKD	SCD2	SCD1	SCD0	OF1	OF0

- Frame Sync is required to tell when data is present.
- Word Synchronization is inherent in the Serial Clock signal.
- Frame Sync generation is optional.

NCD02-1069

FRAME SYNC LENGTH

X:$FFED-SSI Control Register B (CRB) (Read/Write)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RIE	TIE	RE	TE	MOD	GCK	SYN	FSL	0	0	SCKD	SCD2	SCD1	SCD0	OF1	OF0
							*								

*** Word Length FSL = 0**

• Frame Sync occurs while data is valid.

*** One Bit FSL = 1**

• Frame Sync occurs for one bit time preceding the data.

NCD02-1070

SYN BIT

X:$FFED - SSI Control Register B (CRB) (Read/Write)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RIE	TIE	RE	TE	MOD	GCK	SYN	FSL	0	0	SCKD	SCD2	SCD1	SCD0	OF1	OF0
						*									

*** Asynchronous SYN = 0**

• Transmitter and Receiver may have different clocks and frame syncs.

*** Synchronous SYN = 1**

• Transmitter and Receiver have the same clock and frame syncs.

NCD02-1071

MODE BIT

X:$FFED-SSI Control Register B (CRB) (Read/Write)

•	•	•	•	•	•	•	•

TDM NETWORK SOFTWARE FLOWCHART

- The time slot is tracked in software. The example uses variables SLOTCT1 and SLOTCT2.
- The DSP keeps its own time slot in MYSLOT.
- TFS – Transmit Frame Sync Bit indicates if it is the start of a frame.
- If it is not time to transmit, Transmitter underrun is avoided by a dummy write to the slot register.

NCD02-1079

ON DEMAND EXAMPLE

Simple DSP56000 to DSP56000 Interface

Characteristics of On-Demand Mode

- Transmitter Underruns (TUE) are impossible and disabled.
- Non periodic and no time slots are defined.
- Frame Sync and Flags are generated when data is transferred.
- SPI compatible.

NCD02-1080

NETWORK MODE – ON DEMAND, DATA DRIVEN

X:$FFEC-SSI Control Register A (CRA) (Read/Write)

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Gated Clock Control
1=GATED CLOCK

SYN
Sync/Async Control
0=ASYNCHRONOUS

SCKD
Clock Source Direction
1=OUTPUT

SCD0
Serial Control 2 Direction
0=INPUT

- Two SSI Bit Clock times are automatically inserted between each data word. This guarantees Frame Sync will be low between every data word transmitted.

NCD02-1081

OUTPUT FLAG EXAMPLE

• SC0 and SC1 are Ouput Flag 0 and 1 used to software select either Filter 1 or 2.

NCD02-1082

OUTPUT FLAGS

• Applications include Serial Device Chip Selects, Implementing Multidrop Protocols, Generating Bell PCM Signaling Frame Syncs, or Outputting Status Information.

NCD02-1083

INPUT FLAGS

- Input Flag Pin is sampled and latched Synchronous to the first bit sampled in the Receive Data Word.
- Input Flag Pin is Don't Care Until Next Receive Data Word.
- Useful for detecting Bell PCM Signaling Frame Sync, in implementing Multidrop Protocols, or Passing Status Information.

NCD02-1084

3. Reading RX to clear Pending Interrupt.

Transmit Interrupt Service Routine

1. Interrupt is generated when; TIE = 1 and TDE = 1 and TUE = 0.
2. Pending Interrupt is cleared by writing to TX or TSR.

X:$FFEE - SSI Status Register (SR) (Read)

7	6	5	4	3	2	1	0
RDF	TDE	ROE	TUE	RFS	TFS	IF1	IF0

SSI Status Bits

Transmit with Exception Status Interrupt Service Routine

1. Interrupt is generated when: TIE = 1 and TDE = 1 and TUE = 1.
2. TUE is cleared by reading SR, followed by:
3. Writing to TX or TSR to clear Pending Interrupt.

NCD02-1086

DSP56000 RELOCATABLE ASSEMBLER AND LINKER

Objectives:

- Describe the assembler syntax, expressions, and directives.
- Assemble/Link/Load a Program.

NCD02-0800-1

ASSEMBLER COMMAND LINE

```
Usage:  ASM56000 [-A] [-B[<lodfil>]] [-D<symbol> <string>] [-I<ipath>] [-L[<lstfil>]]
                 [-M<mpath>] [-O<opt>[,<opt>...]] <srcfil>...

Where:
        -A      - Create and absolute load module                      Example
        -B      - Create and output object module                      -A
        lodfil  - Optional load file name for assembler output         -BOBJECT.LNK
        -D      - Define a symbol
        symbol  - User-defined symbol
        string  - String associated with symbol                        -DPOINTS '256'
        -I      - Search a directory path for an include file
        ipath   - Include file directory path                          -I\FILTER\IIR\
        -L      - Specify an output listing be generated
        lstfil  - Optional list file name                              -LFILTER.LST
        -M      - Search a directory path for a macro library
        mpath   - Macro library directory path                         -MFFTLIB\
        -O      - Command line assembler option directives
        opt     - Assembler option                                     -OS,CRE
        srcfil  - assembler source file(s)                             SOURCE.ASM

Example:

        ASM56000 -BOBJECT -DPOINTS '256' -I\FILTER\IIR\ -L -MFFTLIB\ -OCRE,S SOURCE
```

NCD02-0801

DEVELOPMENT PROCESS

NCD02-0802

SOURCE STATEMENT FORMATS

Label

<space> or <tab> – No Label

Underscore '_' for the first character is a local label

Alphabetic – first character is a symbol

Comment

; – Preceding a non literal string

; ; – A comment that is not reproduced in the listing

Continuation

- Source statements may be continued on multiple lines up to 255 characters by putting \ as the last character of the line to be continued.

SOURCE STATEMENT \
CONTINUATION OF SOURCE STATEMENT

NCD02-0804

CONSTANTS

Binary	Hexadecimal	Decimal	String
%1011010001	$1AB56C	Integer 12345 Floating Point 6E10 0.6 2.7e2	'ABC' 'DEF'

NCD02-0803

SYMBOLS

- One to 255 characters long.
- First character must be alphabetic A-Z or a-z.
- Remaining characters can be A-Z, a-z, 0-9 or _.
- User-defined symbols are case sensitive.

Valid Symbols	Invalid Symbols
loop_1	1_oop
EXIT	AB*CD
a_b_C_19	HELLO.U

Reserved Symbols

X	A	PC	R0	N0	M0
X0	A0	MR	R1	N1	M1
X1	A1	CCR	R2	N2	M2
Y	A2	SR	R3	N3	M3
Y0	B	LC	R4	N4	M4
Y1	B0	LA	R5	N5	M5
	B1	SS	R6	N6	M6
	B2	SSH	R7	N7	M7
	AB	SSL			
	BA	OMR			
	A10				
	B10				

- Symbols are either a 32 bit integer or 32 bit floating point value.

NCD02-0805-1

OPERATORS

Unary

– Minus
~ Negate, integer only
! Logical negate, integer only

Arithmetic

+ Addition
- Subtraction
* Multiplication
/ Division
% Mod

Bitwise

& AND, integer only
| Inclusive OR, integer only
^ Exclusive OR, integer only

Shift

>> Shift right, integer only
<< Shift left, integer only

Relational

< Less than
> Greater than
== Equal
<= Less than or equal
>= Greater than or equal
! = Not equal

Logical

&& Logical AND
|| Logical OR

NCD02-0806-1

OPERATOR PRECEDENCE

1. Parenthetical expression (innermost first)
2. Unary minus, unary negate, unary logical negation
3. Multiplication, division, mod
4. Addition, subtraction
5. Bitwise AND, OR, EOR
6. Shift
7. Relational Operators
8. Logical AND, OR

- Operators of the same precedence are evaluated left to right.
- These operators cannot be applied to floating point operands.
  - Unary negate
  - Unary logical negate
  - Bitwise operators
  - Shift operators

NCD02-0807

MEMORY SPACE ATTRIBUTES

- Every Symbol carries one of the attributes:
  X, Y, L, P, or None
- The result of an expression will always have a memory space attribute.
- The attribute of an expression with two or more operands or operators is determined by this chart.

Left Operand Memory Space Attribute

Right Operand Memory Space Attribute (R) \ Left Operand (L)	X	Y	L	P	None
X	X	*	X	*	X
Y	*	Y	Y	*	Y
L	X	Y	L	*	L
P	*	*	*	P	P
None	X	Y	L	P	N

* – This operation is illegal and will result in an error.

NCD02-0808

FUNCTIONS (1 OF 3)

	Memory Space Attribute
@ACS(<expression>) - ARC Cosine Result = 0 to pi, <expression> = between -1 and 1	None
@ASN(<expression>) - ARC Sine Result = pi/2 to pi/2, <expression> = between -1 and 1	None
@AT2(<expr1>,<expr2>) - ARC Tangent of <expr1>/<expr2> Result = -pi to pi	None
@ATN (<expression>) - ARC Tangent Result = -pi/2 to pi/2	None
@COS(<expression>) - Cosine	None
@CVF(<expression>) - Convert to floating point value	Same as <expression>
@CVI(<expression>) - Convert to integer value	Same as <expression>
@CVS({X | Y | L | P | N},<expression>) - Convert memory space attribute	Attribute Specified
@DEF(<symbol>) - Returns an Integer 1 (Memory space attribute N) if <symbol> has been defined with the DEFINE directive. Returns 0 otherwise.	N/A

NCD02-0809

FUNCTIONS (2 OF 3)

		Memory Space Attribute
@EXP(<expression>)	- Returns the integer 1 if the evaluation of <expression> would NOT result in errors. Returns 0 otherwise.	N/A
@FRC(<expression>)	- Obtains the binary fractional representation by the transformation @CVI((@POW(2,23)*<expression>)+0.5)	None
@INT(<expression>)	- Returns 1 if <expression> has an integer result. Returns 0 otherwise.	N/A
@LCV({L | R})	- If L, return the value and memory space attribute of the load location counter. If R, return the value and memory space attribute of the runtime location counter	
@L10(<expression>)	- Base 10 Log <expression> = greater than zero	None
@LOG(<expression>)	- Natural Log <expression> = greater than zero	None
@MAC(<symbol>)	- Returns an Integer 1 (Memory space attribute N) if <symbol> has been defined as a macro name. Returns 0 otherwise.	N/A
@MSP(<expression>)	- Return the memory space attribute as an integer: 0 = None 1 = X Space 2 = Y Space 3 = L Space 4 = P Space	X | Y | L | P | N

NCD02-0810

FUNCTIONS (3 OF 3)

	Memory Space Attribute
@POW(<expr1>,<expr2>) - <expr1> raised to the power of <expr2>.	None
@SCP(<string1>,<string2>) - Returns the integer 1 if the two strings compare. Returns 0 otherwise.	N/A
@SIN(<expression>) - Sine	None
@SQT(expression) - Square root	None
@TAN(<expression>) - Tangent	None
@XPN(<expression>) - Exponential function. e to the power of <expression>	None

NCD02-0811

ASSEMBLER SIGNIFICANT CHARACTERS

;	–	Comment delimiter
;;	–	Unreported comment delimiter
\	–	Line continuation character or Macro dummy argument concatenation operator
?	–	Macro value substitution operator
"	–	Macro string delimiter
@	–	Function delimiter
*	–	Location counter substitution
++	–	String concatenation operator
<<	–	I/O short addressing mode force operator
>	–	Long addressing mode force operator
<	–	Short addressing mode force operator
#	–	Immediate addressing mode
#>	–	Immediate long addressing mode force operator
#<	–	Immediate short addressing mode force operator

NCD02-0812

LOAD TIME VS RUNTIME

At runtime the Code Kernel can then copy

1. X Constants to X Memory
2. Y Constants to Y Memory
3. Program Overlay 1 to replace the X and Y Constants that were in Program Memory

NCD02-0813

INITIALIZE MEMORY SPACE AND LOCATION COUNTERS

ORG <rms>[<rlc>]:[<exp1>][,<lms>[<llc>]:[<exp2>]] [<comment>]

<rms>
Which memory space (X, Y, L, or P) will be used as the Runtime Memory Space.

<rlc>
Which runtime counter H, L, or default (if neither H or L is specified), that is associated with the <rms> will be used as the Runtime Location Counter.

<exp1>
Initial value to assign to the runtime counter used as the <ric>. If <exp1> is not specified, then the last value the counter had will be used.

<lms>
Which memory space (X, Y, L, or P) will be the Load Memory Space. If this is not specified, then the <lms> will be the same as the <rms>.

<llc>
Which load counter, H, L, or default (if neither H or L is specified), that is associated with the <lms> will be used as the Load Location Counter.

<exp2>
Initial value to assign to the load counter used as the <llc>. If <exp2> is not specified, then the last value the counter had will be used.

- Each memory space has six counters
  - High load
  - Low load
  - Default load
  - High runtime
  - Low runtime
  - Default runtime

NCD02-0814

ASSEMBLY CONTROL DIRECTIVES

– COMMENT <delimiter> - Start comment lines

```
COMMENT  * Start of comment
           another comment line
         *
```

– DEFINE <symbol> < string> [comment] - Define substitution string

```
DEFINE ARRAYSIZ  '10*SAMPLSIZ'
```

– END [<expression>][<comment>] - End of Source Program

```
END START ; Starting execution address
```

– FAIL [<string>] [<comment>] – Programmer generated error

```
FAIL 'divide by zero' ; Report error in listing
```

– INCLUDE <string> [<comment>] – Include secondary file

```
INCLUDE 'MYPROG\IOEQU' ; MS-DOS file path
```

– RADIX < expression> [<comment>] – Change the input radix for comments

```
RADIX '16; Set input radix to Hex
```

– RDIRECT <direc> [,<direc>,…,<direc>] [<comment>] – Remove directive or mnemonic from table

```
RDIRECT RADIX, MAC
```

– UNDEF [<symbol>] [<comment>] – Undefine DEFINE symbol

```
UNDEF ARRAYSIZ ; Undefines the substitution string
```

– WARN [<string>] [<comment>] – Programmer generated warning

```
WARN 'Does not compute'
```

ASSEMBLER OPTIONS

OPT <option>[,<option>,...,<option>] [<comment>]

CC	Enable cycle counts and clear total cycle count.
NOCC	(default, reset) Disable cycle counts. Does not clear total cycle count.
CEX	Print DC expansions.
NOCEX	(default, reset) Do not print DC expansions.
CL	(default, reset) Print the conditional assembly directives
NOCL	Do not print the conditional assembly directives.
CM	(default, reset) Preserve comment lines of macros when they are defined.
NOCM	Do not preserve comment lines of macros when they are defined.
CONTC	Re-enable cycle counts. Does not clear total cycle counts.
CRE	Print a cross reference table at the end of the source listing.
FC	Fold trailing comments.
NOFC	(default, reset) Inhibit folded comments.
IL	Inhibit source listing.
LOC	Include local labels in the symbol table and cross-reference listing.
MC	(default, reset) Print macro calls.
NOMC	Do not print macro calls.
MD	(default, reset) Print macro definitions.
NOMD	Do not print macro definitions.
MEX	Print macro expansions.
NOMEX	(default, reset) Do not print macro expansions.
MU	Include a memory utilization report in the source listing.
S	Print symbol table at the end of the source listing.
SO	Write symbol information to object file.
U	Print the unassembled lines skipped due to failure to satisfy the condition of a conditional assembly directive.

NCD02-0818

SYMBOL DEFINITION

Start and End Section

SECTION <symbol> [<comment>]

•
•
•

<Section source statements>

•
•
•

ENDSEC [<comment>]

- All labels within a section have <symbol> associated with them.
- Labels outside of a section are global.

Equate a Symbol

<label> EQU [{X: | Y: | L: | P:}] <expression> [<comment>]

A_D_PORT EQU X:$FFC0 ;Analog to Digital Converter

Set a Symbol to a value

< label > SET <expression> [<comment>]

Macro Call

```
N_R_MUL  LA + 5, LB + 5, LC, LD
```

Purge a Macro

```
PMACRO <symbol>[,<symbol>, ,<symbol>] [<comment>]
PMACRO N_R_MUL ;Reclaim macro table space
```

Macro Library

```
MACLIB <pathname> [<comment>]
MACLIB '\MACROS\MATH\'          ;IBMPC
```

NCD02-0821-1

DUPLICATE DIRECTIVES

Duplicate a Sequence of Source Lines

```
[<label>]  DUP <expression> [<comment>]
             •
             •
             •
           ENDM
```

Example:

The sequence of source input statements,

```
COUNT SET 3
      DUP COUNT  ;ASR BY COUNT
      ASR A
      ENDM
```

would generate the following in the source listing:

```
COUNT SET 3
      DUP COUNT  ;ASR BY COUNT
      ASR A
      ASR A
      ASR A
      ENDM
```

Duplicate Sequence with Arguments

```
[<label>]    DUPA    <dummy>,<arg>[,<arg>,...,<arg>] [<comment>]
               •
               •
               •
             ENDM
```

Example:

If the input source file contained the following statements,

```
DUPA    VALUE, 12,32,34
DC      VALUE
ENDM
```

then the assembled source listing would show

```
DUPA    VALUE,12,32,34
DC      12
DC      32
DC      34
ENDM
```

Duplicate with Characters

```
[<label>]    DUPC    <dummy>,<string> [<comment>]
               •
               •
               •
             ENDM
```

Example:

If the input source file contained the following statements,

```
DUPC    VALUE, '123'
DC      VALUE
ENDM
```

then the assembled source listing would show

```
DUPC    VALUE, '123'
DC      1
DC      2
DC      3
ENDM
```

NCD02-0822

LINKER COMMAND LINE

```
Usage:  LNK56000 [-B[<lodfil>]] [-L<library>] [-M[<mapfil>]]
                 [-O<mem>[<ctr>][<map>]:<origin>] [-R[<memfil>]] [<lnkfil>...
                                                          Example
where:
        -B      - Create an output object module
        lodfil  - Optional load file name                 -BOBJECT.LOD
        -L      - Search a library for modules
        library - Library file name                       -LIO.LIB
        -M      - Create a map file
        mapfil  - Optional load map file name             -MFILTER.MAP
        -O      - Specify module origin
        mem     - memory space (X, Y, L, P)
        ctr     - location counter
                  (L-low, H-high, none-default)
        map     - memory mapping
                  (I-internal, E-external, B -bootstrap)
        origin  - memory space origin                     -OPLI:40
        -R      - Read a file for map locations
        memfil  - optional memory map file name           -RLINK.MEM
        lnkfil  - link input file name
```

DIGITAL SIGNAL PROCESSING ALGORITHMS

Objectives:

- Describe the function of a General Purpose Digital Signal Processing System.
- Describe the basic concepts of a Finite Impulse Filter.
- Describe the basic concepts of an Infinite Impulse Response Filter.
- Describe the basic concepts of an Adaptive FIR Filter.

NCD02-0900-2

ANALOG SIGNAL PROCESSING

$$\frac{y(j\omega)}{x(j\omega)} = -\frac{R_f}{R_f}\left[\frac{1}{1 + j\omega R_f C_f}\right]$$

NCD02-0201-1

ANALOG FILTER CHARACTERISTICS

Frequency Characteristics

Drawbacks:

- Filter characteristics change with
  - Temperature
  - Component aging
  - Power supply variation
  - Lot to lot manufacturing
- Low noise immunity
- Requires adjustments
- Little flexibility

NCD02-0202

DIGITAL SIGNAL PROCESSING

NCD02-0203-1

DIGITAL FILTER CHARACTERISTICS

Advantages:

- No aging
- No drift
- No adjustments
- High noise immunity and power supply rejection
- Great flexibility
- Self test

NCD02-0204

ANALOG SIGNAL SAMPLING

Continuous Time
and
Amplitude

f_s = Sampling Frequency

$T = \frac{1}{f_s}$ = Sampling Period

Discrete Time
Continuous
Amplitude

Discrete Time
and
Amplitude

NCD02-0205

ALIASING IN THE TIME DOMAIN

NCD02-0206

ALIASING IN THE FREQUENCY DOMAIN

- Aliasing is caused by sampling the input frequency too slow.
- To prevent aliasing use the NYQUIST criterion (Shannon's theorem)
- $f_s \geq 2 \times f_{max}$

NCD02-0207-1

BANDLIMITING ANTIALIASING FILTER

- Solution to aliasing problem:

Use a low pass filter to restrict the input frequencies to at most one half the sampling frequency

NCD02-0308

ANALOG OUTPUT RECONSTRUCTION FILTER

BASIC DIGITAL SIGNAL PROCESSING EQUATION

$$y(n)=\sum_{k=0}^{M} c(k)\,x(n-k)+\sum_{j=1}^{N} d(j)\,y(n-j)$$

NCD02-0210

DIGITAL SIGNAL PROCESSING SYSTEM
FINITE IMPULSE RESPONSE FILTER

FILTER DESIGN (STEPS)

↓

Start the Design

↓

Spec:

Spec the Digital filter
e.g., Low pass filter with a
Cutoff area fc & Pass band
Ripple of 1db or less.

↓

Approximation Problem:

Obtain an Input-Output Characterization
of the filter
[(such as H(2)] that satisfies the spec.

↓

Realization Problem:

Obtain a Realization that defines the internal structure of the filter that has a transfer function H(2). The realization is chosen to optimize the criteria associated with the actual computation.

↓

Implementation:

Determine H/W to Implement the realization so that the complexity is minimized & the data throughput is optimized.

NCD02-0924

DIGITAL FILTERING

ADVANTAGES

- Sharper cutoff
- Better stability over time
- Deterministic
- Adaptive filtering
- Easy to implement

NCD02-0901

DIGITAL FILTER TYPES

- Two Kinds

1. Non - recursive Filter - Finite Inpulse Response (FIR)

$$y(n) = \sum_{k=0}^{N-1} c(k)x(n-k)$$

2. Recursive Filter - Infinite Impulse Response (IIR)

$$y(n) = \sum_{k=0}^{M-1} c(k)x(n-k) - \sum_{j=0}^{N-1} d(j)y(n-j)$$

NCD02-0902-1

DIRECT FORM FINITE IMPULSE RESPONSE FILTER

Equation

$$Y(n) = \sum_{K=0}^{M-1} C(K)\, X(n-K)$$

FIR FILTER REALIZATION

DSP56000 Hardware Implementation

DSP56000 Software Implementation

MAC	X0,Y0,A	X:(R0)+,X0	Y:(R4)+,Y0

NCD02-0904

FOUR TAP FIR FILTER EXAMPLE

Equation

$$Y(n) = \sum_{k=0}^{3} C(K)\ X(n-K)$$

$$Y(n) = C(0)\ X(n) + C(1)\ X(n-1) + C(2)\ X(n-2) + C(3)\ X(n-3)$$

with z transform:

$$\frac{Y(z)}{X(z)} = C(0) + C(1)z^{-1} + C(2)z^{-2} + C(3)z^{-3}$$

where:
- X(n) = input sample at time nT
- Y(n) = output sample at time nT
- T = sampling period
- C(n) = filter impulse response at time nT
- C(0) = 0.1
- C(1) = 0.3
- C(2) = –0.1
- C(3) = 0.2

DSP56200
CASCADABLE ADAPTIVE FINITE IMPULSE RESPONSE DIGITAL FILTER (CAFIR)

Objectives:

- Describe DSP56200 Host Transfers.
- Describe the dual FIR mode or the DSP56200.
- Describe the adaptive FIR mode of the DSP56200.

NCD02-1100-1

DSP56200 FEATURES

- Three Operational Modes
  - Single Channel FIR Filter
  - Dual Channel FIR Filter
  - Single Channel Adaptive FIR Filter with DC Tap and Leakage Control
- High Performance Architecture Optimized for Digital Filtering
  - 24 X 16 Multiplication with 40-Bit Accumulation
  - 97.5 Nanosecond Cycle Time
  - Static 256 x 24-Bit Coefficient RAM
  - Static 256 x 16-Bit Data RAM
  - Low-Power Standby Mode
  - Three Execution Units Operate in Parallel
  - Multiple Internal Buses
- Cascadable
  - Longer Tap-Length Filters
  - Higher Sampling Rates
- High Data Throughput Rates
  - 227 kHz FIR Filter, 32 Taps (Single Chip)
  - 37 kHz FIR Filter, 256 Taps (Single Chip)
  - 115 kHz Adaptive Filter, 256 Taps (8 Cascaded Chips)
  - Many Other Configurations Possible
- Simple Memory-Mapped Interface to Popular Hosts
  - Microprocessors and Microcomputers
  - General Purpose Digital Signal Processors

PINOUT

Functional Pinout

Pin Assignment

NCD02-1102

INTERNAL ARCHITECTURE

SINGLE FIR MODE

MC68000 TO DSP56200 HOST INTERFACE

DSP56200 REGISTER MODEL (1 of 3)

- Bank 1 – Used for Initialization

DSP56200 REGISTER MODEL (2 of 3)

- Bank 0 – Used for Normal Operation

DSP56200 REGISTER MODEL (3 of 3)

- Configuration Register – Used for System Control

NCD02-1107

DSP56200 OPERATION

- Flow Diagram - Standalone Single FIR

Note: The parallel interface is double buffered. A START pulse is used to transfer the data from the byte wide input buffers to the internal registers with one exception. Bit 0 of the configuration register is transferred immediately to change the bank selection.

NCD02-1108

□ DSP56200 autoincrements this register.

HOST INTERFACE TRANSFERS

HOST INTERFACE TRANSFER EXAMPLES

DUAL FIR MODE

- Filter Lengths Must be the Same.

NCD02-1112

DUAL FIR REGISTER MODEL

DUAL FIR OPERATION

ADAPTIVE FIR FILTER MODE

ADAPTIVE FIR SYSTEM EXAMPLE

COEFFICIENT UPDATE

Configuration Register

$$h(i)_{new} = h(i)_{old} + Ke \times (n-i) \pm Leakage \qquad e(n) = d(n) - \sum_{i=0}^{N-1} h(i) \times (n-i)$$

NCD02-1117

ADAPTIVE FILTER REGISTER MODEL

• Bank 0

FIR Tap Length Used	* Maximum Recommended K
32 (20 Hex)	6000 Hex
64 (40 Hex)	3000 Hex
128 (80 Hex)	1000 Hex
192 (C0 Hex)	A00 Hex
256 (FF Hex)	900 Hex

* M. M. Sondhi, D. A. Berkely, "Silencing Echoes on the Telephone Network", Proc. IEEE, Vol. 68, No. 8, pp. 948-963, Aug. 1980.

NCD02-1118

LEAKAGE

• Used to slowly push a coefficient toward zero.

NCD02-1119

DC TAP

NCD02-1120

CASCADING

- Not Permitted in Dual FIR Mode
- Advantages
  1. Allows longer-tap filters
  2. Provides 3-way tradeoff:
     - # Taps/chip
     - # Chips used
     - Maximum sampling rate

NCD02-1121

CASCADED FIR FILTER
