# DSP56305

Advance Information
SINGLE CHIP CHANNEL CODEC DIGITAL SIGNAL PROCESSOR

Motorola designed the DSP56305 to deliver the high performance required to support Global System for Mobile (GSM) communications applications that use digital signal processing to perform channel equalization, channel coding, and speech coding. By combining three dedicated on-chip hardware co-processors (filter, Viterbi, and cyclic code) with a DSP56300 core, the DSP56305 performs all the complex signal processing required by a single Radio Frequency (RF) carrier in one chip, satisfying the demand for high integration cost effectively. The DSP56300 core includes an on-chip PLL, a Data ALU, an instruction cache, on-chip debugging modules, on-chip program and data memory, six DMA channels, and an external memory expansion port. In addition to the co-processors, the DSP56305 provides two types of serial ports, a PCI/Universal bus 32-bit Host Interface, and timers (see **Figure 1**). The DSP56305 provides an industry-leading performance rate of 80 MIPS at 3.3 V.

Data Sheet Conventions

This data sheet uses the following conventions:

$\overline{\text{OVERBAR}}$ Used to indicate a signal that is active when pulled low (For example, the $\overline{\text{RESET}}$ pin is active when low.)

"asserted"   Means that a high true (active high) signal is high or that a low true (active low) signal is low

"deasserted"   Means that a high true (active high) signal is low or that a low true (active low) signal is high

Examples:

Signal/Symbol	Logic State	Signal State	Voltage[1]
$\overline{\text{PIN}}$	True	Asserted	V_{IL}/V_{OL}
$\overline{\text{PIN}}$	False	Deasserted	V_{IH}/V_{OH}
PIN	True	Asserted	V_{IH}/V_{OH}
PIN	False	Deasserted	V_{IL}/V_{OL}

Note: Values for V_{IL}, V_{OL}, V_{IH}, and V_{OH} are defined by individual product specifications.

DSP56305 FEATURES

High Performance DSP56300 Core

- 80 Million Instructions Per Second (MIPS) with an 80 MHz clock at 3.3 V
- Object code compatible with the DSP56000 core
- Highly parallel instruction set
- Data Arithmetic Logic Unit (ALU)
  - Fully pipelined 24 x 24-bit parallel Multiplier-Accumulator
  - 56-bit parallel barrel shifter (fast shift and normalization; bit stream generation and parsing)
  - Conditional ALU instructions
  - 24-bit or 16-bit arithmetic support under software control
- Program Control Unit (PCU)
  - Position Independent Code (PIC) support
  - Addressing modes optimized for DSP applications (including immediate offsets)
  - On-chip instruction cache controller
  - On-chip memory-expandable hardware stack
  - Nested hardware DO loops
  - Fast auto-return interrupts
- Direct Memory Access (DMA)
  - Six DMA channels supporting internal and external accesses
  - One-, two-, and three- dimensional transfers (including circular buffering)
  - End-of-block-transfer interrupts
  - Triggering from interrupt lines and all peripherals
- Phase Lock Loop (PLL)
  - Allows change of low power Divide Factor (DF) without loss of lock
  - Output clock with skew elimination

- Hardware debugging support

    – On-Chip Emulation (OnCE™) module

    – Joint Action Test Group (JTAG) Test Access Port (TAP) port

    – Address tracing mode reflects internal Program RAM accesses at the
      external port

On-Chip Memories

- Program RAM, instruction cache, X data RAM, and Y data RAM sizes are
  programmable:

Program RAM Size	Instruction Cache Size	X Data RAM Size	Y Data RAM Size	Instruction Cache[1]	Switch Mode[2]
6656×24-bit	0	3840×24-bit	2048×24-bit	disabled (CE = 0)	disabled (MS = 0)
5632×24-bit	1024×24-bit	3840×24-bit	2048×24-bit	enabled (CE = 1)	disabled (MS = 0)
7680×24-bit	0	2816×24-bit	2048×24-bit	disabled (CE = 0)	enabled (MS = 1)
6656×24-bit	1024×24-bit	2816×24-bit	2048×24-bit	enabled (CE = 1)	enabled (MS = 1)

Note: 1.   Controlled by the Cache Enable (CE) bit in the Status Register (SR)
        2.   Controlled by the Memory Select (MS) bit in the Operating Mode Register (OMR)

- 6144×24-bit Program ROM

- 3072×24-bit Y data ROM

- 192×24-bit bootstrap ROM

Off-Chip Memory Expansion

- Data memory expansion to two $16\,M \times 24$-bit word memory spaces in 24-Bit
  mode or two $64\,K \times 16$-bit memory spaces in 16-Bit Compatibility mode

- Program memory expansion to one $16\,M \times 24$-bit words memory space in
  24-Bit mode or $64\,K \times 16$-bit in 16-Bit Compatibility mode

- External memory expansion port

- Chip select logic provides glueless interface to SRAMs and SSRAMs

- On-chip DRAM controller provides glueless interface to DRAMs

On-Chip Peripherals

- PCI Rev. 2.1-compliant 32-bit parallel PCI/Universal Host Interface (HI32) with glueless interface to other DSP563xx buses

- ISA interface requires only 74LS45-style buffer

- Two Enhanced Synchronous Serial Interfaces (ESSI0 and ESSI1)

- Serial Communications Interface (SCI) with baud rate generator

- Triple timer module

- Up to forty-two programmable General Purpose Input/Output pins (GPIO), depending on which peripherals are enabled

On-Chip Co-Processors

- Filter Co-Processor (FCOP) implements a wide variety of convolution and correlation filtering algorithms. In GSM applications, the FCOP cross-correlates between the received training sequence and a known midamble sequence to estimate the channel impulse response, and then performs match filtering of received data symbols using coefficients derived from that estimated channel.

- Viterbi Co-Processor (VCOP) implements a Maximum Likelihood Sequential Estimation (MLSE) algorithm for channel decoding and equalization (uplink) and channel convolution coding (downlink). The VCOP supports constraint lengths (k) of 4, 5, 6, or 7 with number of states 8, 16, 32, or 64, respectively; code rates of 1/2, 1/3, 1/4, or 1/6; and trace-back Trellis depth of 36.

- Cyclic-code Co-Processor (CCOP) executes cyclic code calculations for data ciphering and deciphering, as well as parity code generation and check. The CCOP is fully programmable and not dedicated to a specific algorithm, but it is well suited for GSM A5.1 and A5.2 data ciphering algorithms. The CCOP can generate mask sequences for data ciphering, and supports Fire encode and decode for burst error correction, as well as generation of Cyclic Redundancy Code (CRC) syndrome for any polynomial of any degree up to 48.

Reduced Power Dissipation

- Very low power CMOS design

- Wait and Stop low power standby modes

- Fully-static logic, operation frequency down to DC

- Optimized power management circuitry

PRODUCT DOCUMENTATION

The three documents listed in **Table 1** are required for a complete description of the DSP56305 and are necessary to design properly with the part. Documentation is available from one of the following locations (see back cover for detailed information):

- A local Motorola distributor

- A Motorola semiconductor sales office

- A Motorola Literature Distribution Center

- The World Wide Web (WWW) (the source for the latest information)

Table 1   DSP56305 Documentation

Topic	Description	Order Number
DSP56300 Family Manual	Detailed description of the DSP56300 family architecture, 24-bit core, and instruction set	DSP56300FM/AD
DSP56305 User's Manual	Detailed description of DSP56305 memory, peripherals, and interfaces	DSP56305UM/AD
DSP56305 Technical Data	DSP56305 pin and package descriptions, and electrical and timing specifications	DSP56305/D

SECTION 1

SIGNAL/CONNECTION DESCRIPTIONS

SIGNAL GROUPINGS

The input and output signals of the DSP56305 are organized into functional groups, as shown in **Table 1-1** and as illustrated in **Figure 1-1**.

The DSP56305 is operated from a 3 V supply; however, some of the inputs can tolerate 5 V. A special notice for this feature is added to the signal descriptions of those inputs.

Table 1-1   DSP56305 Functional Signal Groupings

Functional Group		Number of Signals	Detailed Description
Power (V_{CC})		25	**Table 1-2**
Ground (GND)		26	**Table 1-3**
Clock		2	**Table 1-4**
PLL		3	**Table 1-5**
Address Bus	Port A[1]	24	**Table 1-6**
Data Bus		24	**Table 1-7**
Bus Control		15	**Table 1-8**
Interrupt and Mode Control		5	**Table 1-9**
Host Interface (HI32)	Port B[2]	52	**Table 1-11**
Extended Synchronous Serial Interface (ESSI)	Ports C and D[3]	12	**Table 1-12** and **Table 1-13**
Serial Communication Interface (SCI)	Port E[4]	3	**Table 1-14**
Timer		3	**Table 1-15**
JTAG/OnCE Port		6	**Table 1-16**

Note: 1.   Port A signals define the external memory interface port, including the external address bus, data bus, and control signals.
2.   Port B signals are the HI32 port signals multiplexed with the GPIO signals.
3.   Port C and D signals are the two ESSI port signals multiplexed with the GPIO signals.
4.   Port E signals are the SCI port signals multiplexed with the GPIO signals.

Figure 1-1 is a diagram of DSP56305 signals by functional group.

Signal Groupings
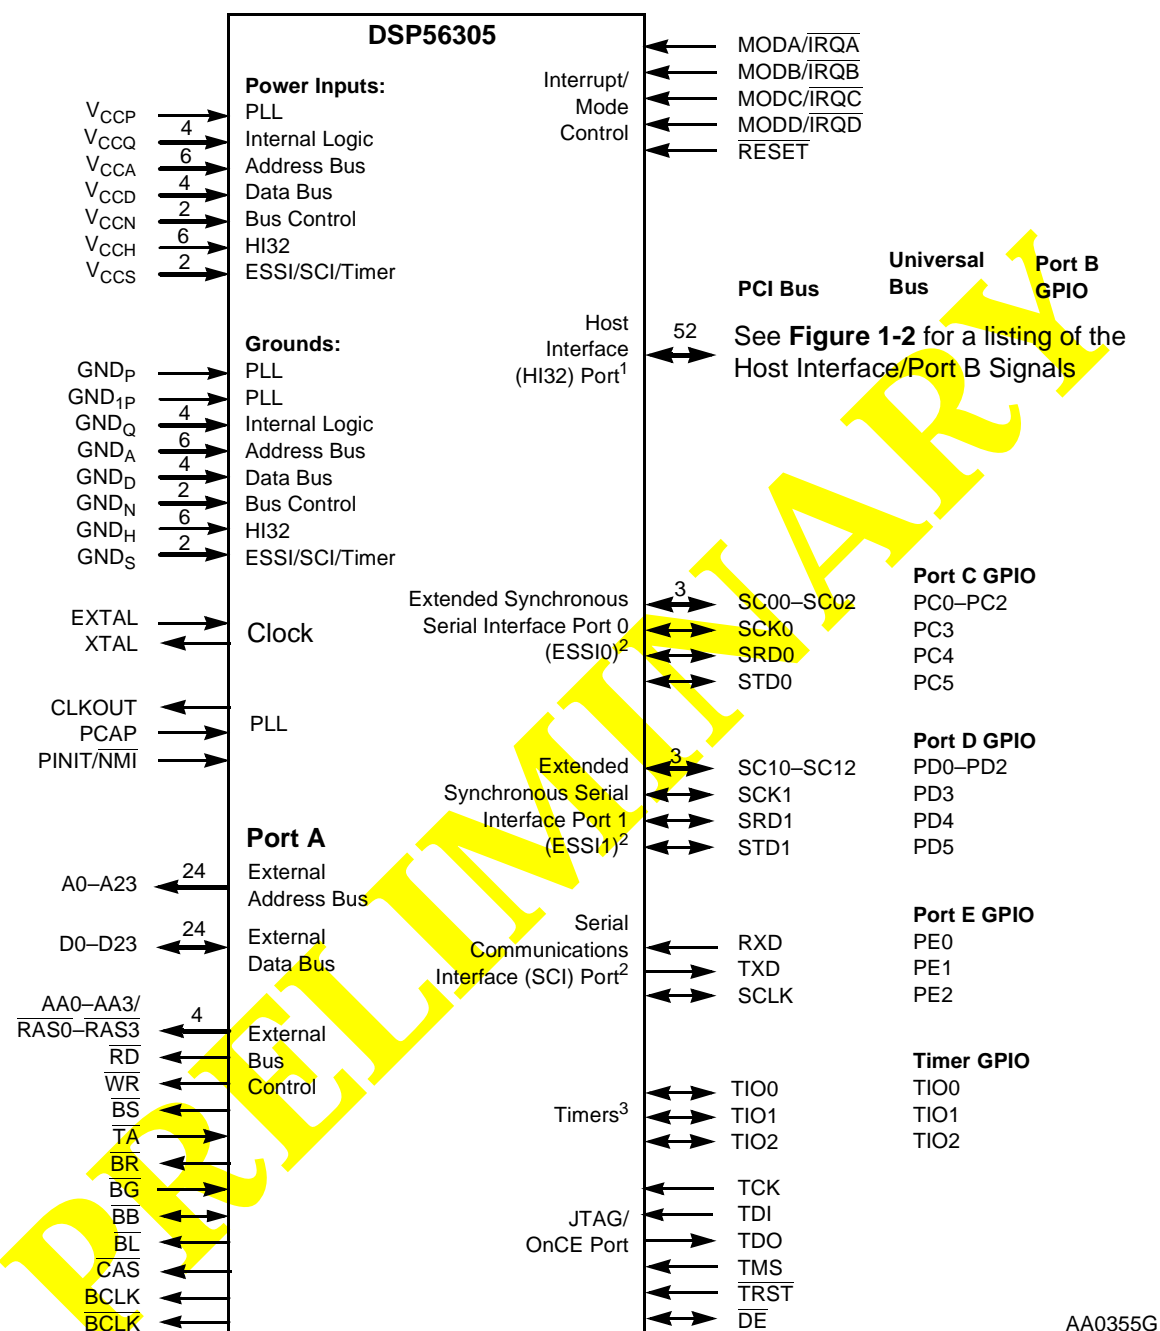

Note: 1. The HI32 port supports PCI and non-PCI bus configurations. Twenty-four of these HI32 signals can also be configured alternately as GPIO signals (PB0–PB23).
2. The ESSI0, ESSI1, and SCI signals are multiplexed with the Port C GPIO signals (PC0–PC5), Port D GPIO signals (PD0–PD5), and Port E GPIO signals (PE0–PE2), respectively.
3. TIO0–TIO2 can be configured as GPIO signals.

	HAD31	HD23	Internal disconnect	HP48
	$\overline{\text{HRST}}$	HRST	Internal disconnect	HP49
	$\overline{\text{HINTA}}$	$\overline{\text{HINTA}}$	Internal disconnect	HP50
	PVCL	Leave unconnected	Leave unconnected	PVCL

Note: HPxx is a reference only and is not a signal name. GPIO references formerly designated as HIOxx have been renamed PBxx for consistency with other Motorola DSPs.

Figure 1-2 Host Interface/Port B Detail Signal Diagram

POWER

Table 1-2 Power Inputs

Power Name	Description
V_{CCP}	**PLL Power**—V_{CCP} provides isolated power for the Phase Lock Loop (PLL). The voltage should be well-regulated and the input should be provided with an extremely low impedance path to the V_{CC} power rail. There is one V_{CCP} input.
V_{CCQ} (4)	**Quiet Power**—V_{CCQ} provides isolated power for the internal processing logic. This input must be tied externally to all other chip power inputs. The user must provide adequate external decoupling capacitors. There are four V_{CCQ} inputs.
V_{CCA} (6)	**Address Bus Power**—V_{CCA} provides isolated power for sections of the address bus I/O drivers. This input must be tied externally to all other chip power inputs. The user must provide adequate external decoupling capacitors. There are six V_{CCA} inputs.
V_{CCD} (4)	**Data Bus Power**—V_{CCD} provides isolated power for sections of the data bus I/O drivers. This input must be tied externally to all other chip power inputs. The user must provide adequate external decoupling capacitors. There are four V_{CCD} inputs.
V_{CCN} (2)	**Bus Control Power**—V_{CCN} provides isolated power for the bus control I/O drivers. This input must be tied externally to all other chip power inputs. The user must provide adequate external decoupling capacitors. There are two V_{CCN} inputs.
V_{CCH} (6)	**Host Power**—V_{CCH} provides isolated power for the HI32 I/O drivers. This input must be tied externally to all other chip power inputs. The user must provide adequate external decoupling capacitors. There is one V_{CCH} input.
V_{CCS} (2)	**ESSI, SCI, and Timer Power**—V_{CCS} provides isolated power for the ESSI, SCI, and timer I/O drivers. This input must be tied externally to all other chip power inputs. The user must provide adequate external decoupling capacitors. There are two V_{CCS} inputs.
Note:	These designations are package-dependent. Some packages connect all V_{CC} inputs except V_{CCP} to each other internally. On those packages, all power input, except V_{CCP}, are labeled V_{CC}. The numbers of connections indicated in this table are minimum values; the total V_{CC} connections are package-dependent.

GROUND

Table 1-3 Grounds

Ground Name	Description
GND_P	**PLL Ground**—GND_P is ground dedicated for PLL use. The connection should be provided with an extremely low-impedance path to ground. V_{CCP} should be bypassed to GND_P by a 0.47 µF capacitor located as close as possible to the chip package. There is one GND_P connection.
GND_{1P}	**PLL Ground 1**—GND_{1P} is ground dedicated for PLL use. The connection should be provided with an extremely low-impedance path to ground. There is one GND_{P1} connection.
GND_Q (4)	**Quiet Ground**—GND_Q provides isolated ground for the internal processing logic. This connection must be tied externally to all other chip ground connections. The user must provide adequate external decoupling capacitors. There are four GND_Q connections.
GND_A (6)	**Address Bus Ground**—GND_A provides isolated ground for sections of the address bus I/O drivers. This connection must be tied externally to all other chip ground connections. The user must provide adequate external decoupling capacitors. There are four GND_A connections.
GND_D (4)	**Data Bus Ground**—GND_D provides isolated ground for sections of the data bus I/O drivers. This connection must be tied externally to all other chip ground connections. The user must provide adequate external decoupling capacitors. There are four GND_D connections.
GND_N (2)	**Bus Control Ground**—GND_N provides isolated ground for the bus control I/O drivers. This connection must be tied externally to all other chip ground connections. The user must provide adequate external decoupling capacitors. There are two GND_N connections.
GND_H (6)	**Host Ground**—GND_H provides isolated ground for the HI32 I/O drivers. This connection must be tied externally to all other chip ground connections. The user must provide adequate external decoupling capacitors. There is one GND_H connection.
GND_S (2)	**ESSI, SCI, and Timer Ground**—GND_S provides isolated ground for the ESSI, SCI, and timer I/O drivers. This connection must be tied externally to all other chip ground connections. The user must provide adequate external decoupling capacitors. There are two GND_S connections.
Note:	These designations are package-dependent. Some packages connect all GND inputs except GND_P and GND_{1P} to each other internally. On those packages, all power input, except GND_P and GND_{1P}, are labeled GND. The numbers of connections indicated in this table are minimum values; the total GND connections are package-dependent.

CLOCK

Table 1-4 Clock Signals

Signal Name	Type	State During Reset	Signal Description
EXTAL	Input	Input	**External Clock/Crystal Input**—EXTAL interfaces the internal crystal oscillator input to an external crystal or an external clock.
XTAL	Output	Chip Driven	**Crystal Output**—XTAL connects the internal crystal oscillator output to an external crystal. If an external clock is used, leave XTAL unconnected.

PHASE LOCK LOOP (PLL)

Table 1-5 Phase Lock Loop Signals

Signal Name	Type	State During Reset	Signal Description
PCAP	Input	Input	**PLL Capacitor**—PCAP is an input connecting an off-chip capacitor to the PLL filter. Connect one capacitor terminal to PCAP and the other terminal to V_{CCP}. If the PLL is not used, PCAP may be tied to V_{CC}, GND, or left floating.
CLKOUT	Output	Chip-driven	**Clock Output**—CLKOUT provides an output clock synchronized to the internal core clock phase. If the PLL is enabled and both the multiplication and division factors equal one, then CLKOUT is also synchronized to EXTAL. If the PLL is disabled, the CLKOUT frequency is half the frequency of EXTAL.
PINIT/$\overline{\text{NMI}}$	Input	Input	**PLL Initial/Non-Maskable Interrupt**—During assertion of $\overline{\text{RESET}}$, the value of PINIT/$\overline{\text{NMI}}$ is written into the PLL Enable (PEN) bit of the PLL control register, determining whether the PLL is enabled or disabled. After $\overline{\text{RESET}}$ deassertion and during normal instruction processing, the PINIT/$\overline{\text{NMI}}$ Schmitt-trigger input is a negative-edge-triggered Non-Maskable Interrupt (NMI) request internally synchronized to CLKOUT. PINIT/$\overline{\text{NMI}}$ can tolerate 5 V.

EXTERNAL MEMORY EXPANSION PORT (PORT A)

Note: When the DSP56305 enters a low-power standby mode (Stop or Wait), it releases bus mastership and tri-states the relevant Port A signals: A0–A17, D0–D23, AA0/$\overline{RAS0}$–AA3/$\overline{RAS3}$, $\overline{RD}$, $\overline{WR}$, $\overline{BS}$, $\overline{CAS}$, BCLK, and $\overline{BCLK}$.

Note: If hardware refresh of external DRAM is enabled, Port A exits the Wait mode to allow the refresh to occur and then returns to the Wait mode.

EXTERNAL ADDRESS BUS

Table 1-6 External Address Bus Signals

Signal Name	Type	State During Reset, Wait, or Stop	Signal Description
A0–A23	Output	Tri-stated	**Address Bus**—When the DSP is the bus master, A0–A23 are active-high outputs that specify the address for external program and data memory accesses. Otherwise, the signals are tri-stated. To minimize power dissipation, A0–A23 do not change state when external memory spaces are not being accessed.

EXTERNAL DATA BUS

Table 1-7 External Data Bus Signals

Signal Name	Type	State During Reset, Wait, or Stop	Signal Description
D0–D23	Input/ Output	Tri-stated	**Data Bus**—When the DSP is the bus master, D0–D23 are active-high, bidirectional input/outputs that provide the bidirectional data bus for external program and data memory accesses. Otherwise, D0–D23 are tri-stated.

EXTERNAL BUS CONTROL

Table 1-8 External Bus Control Signals

Signal Name	Type	State During Reset, Wait, or Stop	Signal Description
AA0–AA3/ $\overline{RAS0}$–$\overline{RAS3}$	Output	Tri-stated	**Address Attribute or Row Address Strobe**—When defined as AA, these signals can be used as chip selects or additional address lines. When defined as $\overline{RAS}$, these signals can be used as $\overline{RAS}$ for Dynamic Random Access Memory (DRAM) interface. These signals are tri-statable outputs with programmable polarity.

Table 1-8 External Bus Control Signals (Continued)

Signal Name	Type	State During Reset, Wait, or Stop	Signal Description
$\overline{\text{RD}}$	Output	Tri-stated	**Read Enable**—When the DSP is the bus master, $\overline{\text{RD}}$ is an active-low output that is asserted to read external memory on the data bus (D0–D23). Otherwise, $\overline{\text{RD}}$ is tri-stated.
$\overline{\text{WR}}$	Output	Tri-stated	**Write Enable**—When the DSP is the bus master, $\overline{\text{WR}}$ is an active-low output that is asserted to write external memory on the data bus (D0–D23). Otherwise, the signals are tri-stated.
$\overline{\text{BS}}$	Output	Tri-stated	**Bus Strobe**—When the DSP is the bus master, $\overline{\text{BS}}$ is asserted for half a clock cycle at the start of a bus cycle to provide an "early bus start" signal for a bus controller. If the external bus is not used during an instruction cycle, $\overline{\text{BS}}$ remains deasserted until the next external bus cycle.
$\overline{\text{TA}}$	Input	Ignored Input	**Transfer Acknowledge**—If the DSP56305 is the bus master and there is no external bus activity, or the DSP56305 is not the bus master, the $\overline{\text{TA}}$ input is ignored. The $\overline{\text{TA}}$ input is a Data Transfer Acknowledge (DTACK) function that can extend an external bus cycle indefinitely. Any number of wait states (1, 2,..., infinity) may be added to the wait states inserted by the Bus Control Register (BCR) by keeping $\overline{\text{TA}}$ deasserted. In typical operation, $\overline{\text{TA}}$ is deasserted at the start of a bus cycle, is asserted to enable completion of the bus cycle, and is deasserted before the next bus cycle. The current bus cycle completes one clock period after $\overline{\text{TA}}$ is asserted synchronous to CLKOUT. The number of wait states is determined by the $\overline{\text{TA}}$ input or by the BCR, whichever is longer. The BCR can be used to set the minimum number of wait states in external bus cycles. In order to use the $\overline{\text{TA}}$ functionality, the BCR must be programmed to at least one wait state. A zero wait state access can not be extended by $\overline{\text{TA}}$ deassertion, otherwise improper operation may result. $\overline{\text{TA}}$ can operate synchronously or asynchronously depending on the setting of the TAS bit in the Operating Mode Register (OMR). $\overline{\text{TA}}$ functionality may not be used while performing DRAM type accesses, otherwise improper operation may result.

Table 1-**8**   External Bus Control Signals (Continued)

Signal Name	Type	State During Reset, Wait, or Stop	Signal Description
$\overline{BR}$	Output	Driven high (deasserted)	**Bus Request**—$\overline{BR}$ is an active-low output, never tri-stated. $\overline{BR}$ is asserted when the DSP requests bus mastership. $\overline{BR}$ is deasserted when the DSP no longer needs the bus. $\overline{BR}$ may be asserted or deasserted independent of whether the DSP56305 is a bus master or a bus slave. Bus "parking" allows $\overline{BR}$ to be deasserted even though the DSP56305 is the bus master (see the description of bus "parking" in the $\overline{BB}$ signal description). The Bus Request Hole (BRH) bit in the BCR allows $\overline{BR}$ to be asserted under software control even though the DSP does not need the bus. $\overline{BR}$ is typically sent to an external bus arbitrator that controls the priority, parking, and tenure of each master on the same external bus. $\overline{BR}$ is only affected by DSP requests for the external bus, never for the internal bus. During hardware reset, $\overline{BR}$ is deasserted and the arbitration is reset to the bus Slave state.
$\overline{BG}$	Input	Ignored Input	**Bus Grant**—$\overline{BG}$ is asserted by an external bus arbitration circuit when the DSP56305 becomes the next bus master. $\overline{BG}$ must be asserted/deasserted synchronous to CLKOUT for proper operation. When $\overline{BG}$ is asserted, the DSP56305 must wait until $\overline{BB}$ is deasserted before taking bus mastership. When $\overline{BG}$ is deasserted, bus mastership is typically given up at the end of the current bus cycle. This may occur in the middle of an instruction that requires more than one external bus cycle for execution.
$\overline{BB}$	Input/ Output	Input	**Bus Busy**—$\overline{BB}$ indicates that the bus is active. $\overline{BB}$ must be asserted and deasserted synchronous to CLKOUT. Only after $\overline{BB}$ is deasserted can the pending bus master become the bus master (and then assert the signal again). The bus master may keep $\overline{BB}$ asserted after ceasing bus activity regardless of whether $\overline{BR}$ is asserted or deasserted. This is called "bus parking" and allows the current bus master to reuse the bus without re-arbitration until another device requires the bus. The deassertion of $\overline{BB}$ is done by an "active pull-up" method (i.e., $\overline{BB}$ is driven high and then released and held high by an external pull-up resistor). $\overline{BB}$ requires an external pull-up resistor.

Table 1-8 External Bus Control Signals (Continued)

Signal Name	Type	State During Reset, Wait, or Stop	Signal Description
$\overline{BL}$	Output	Driven high (deasserted)	**Bus Lock**—$\overline{BL}$ is asserted at the start of an external divisible Read-Modify-Write (RMW) bus cycle, remains asserted between the read and write cycles, and is deasserted at the end of the write bus cycle. This provides an "early bus start" signal for the bus controller. BL may be used to "resource lock" an external multi-port memory for secure semaphore updates. Early deassertion provides an "early bus end" signal useful for external bus control. If the external bus is not used during an instruction cycle, BL remains deasserted until the next external indivisible RMW cycle. The only instructions that assert $\overline{BL}$ automatically are the BSET, CLR, and BCHG instructions when they are used to modify external memory. An operation can also assert $\overline{BL}$ by setting the BLH bit in the Bus Control Register.
$\overline{CAS}$	Output	Tri-stated	**Column Address Strobe**—When the DSP is the bus master, $\overline{CAS}$ is used by DRAM to strobe the column address. Otherwise, if the Bus Mastership Enable (BME) bit in the DRAM Control Register is cleared, the signal is tri-stated.
BCLK	Output	Tri-stated	**Bus Clock**—When the DSP is the bus master, BCLK is an active-high output used by Synchronous Static Random Access Memory (SSRAM) to sample address, data, and control signals. BCLK is active either during SSRAM accesses or as a sampling signal when the program Address Tracing mode is enabled (by setting the ATE bit in the OMR). When BCLK is active and synchronized to CLKOUT by the internal PLL, BCLK precedes CLKOUT by one-fourth of a clock cycle. The BCLK rising edge may be used to sample the internal Program Memory access on the A0–A23 address lines.
$\overline{BCLK}$	Output	Tri-stated	**Bus Clock**—When the DSP is the bus master, $\overline{BCLK}$ is an active-low output that is the inverse of the BCLK signal. When the DSP is not the bus master, the signal is tri-stated.

INTERRUPT AND MODE CONTROL

The interrupt and mode control signals select the chip's operating mode as it comes out of hardware reset. After $\overline{\text{RESET}}$ is deasserted, these inputs are hardware interrupt request lines.

Table 1-**9**   Interrupt and Mode Control

Signal Name	Type	State During Reset	Signal Description
$\overline{\text{RESET}}$	Input	Input	**Reset**—$\overline{\text{RESET}}$ is an active-low, Schmitt-trigger input. Deassertion of $\overline{\text{RESET}}$ is internally synchronized to the clock out (CLKOUT). When asserted, the chip is placed in the Reset state and the internal phase generator is reset. The Schmitt-trigger input allows a slowly rising input (such as a capacitor charging) to reset the chip reliably. If $\overline{\text{RESET}}$ is deasserted synchronous to CLKOUT, exact start-up timing is guaranteed, allowing multiple processors to start synchronously and operate together in "lock-step." When the $\overline{\text{RESET}}$ signal is deasserted, the initial chip operating mode is latched from the MODA, MODB, MODC, and MODD inputs. The $\overline{\text{RESET}}$ signal must be asserted after power up. This input is 5 V tolerant.
MODA	Input	Input	**Mode Select A**—MODA selects the initial chip operating mode during hardware reset and becomes a level-sensitive or negative-edge-triggered, maskable interrupt request input $\overline{\text{IRQA}}$ during normal instruction processing. MODA, MODB, MODC, and MODD select one of sixteen initial chip operating modes, latched into the OMR when the $\overline{\text{RESET}}$ signal is deasserted.
$\overline{\text{IRQA}}$	Input		**External Interrupt Request A**—$\overline{\text{IRQA}}$ is an active-low Schmitt-trigger input, internally synchronized to CLKOUT. If $\overline{\text{IRQA}}$ is asserted synchronous to CLKOUT, multiple processors can be re-synchronized using the WAIT instruction and asserting $\overline{\text{IRQA}}$ to exit the Wait state. If the processor is in the Stop standby state and $\overline{\text{IRQA}}$ is asserted, the processor will exit the Stop state. These inputs are 5 V tolerant.

Table 1-9 Interrupt and Mode Control (Continued)

Signal Name	Type	State During Reset	Signal Description
MODB	Input	Input	**Mode Select B**—MODB selects the initial chip operating mode during hardware reset and becomes a level-sensitive or negative-edge-triggered, maskable interrupt request input $\overline{\text{IRQB}}$ during normal instruction processing. MODA, MODB, MODC, and MODD select one of sixteen initial chip operating modes, latched into the OMR when the $\overline{\text{RESET}}$ signal is deasserted.
$\overline{\text{IRQB}}$	Input		**External Interrupt Request B**—$\overline{\text{IRQB}}$ is an active-low Schmitt-trigger input, internally synchronized to CLKOUT. If $\overline{\text{IRQB}}$ is asserted synchronous to CLKOUT, multiple processors can be re-synchronized using the WAIT instruction and asserting $\overline{\text{IRQB}}$ to exit the Wait state. If the processor is in the Stop standby state and $\overline{\text{IRQC}}$ is asserted, the processor will exit the Stop state. These inputs are 5 V tolerant.
MODC	Input	Input	**Mode Select C**—MODC selects the initial chip operating mode during hardware reset and becomes a level-sensitive or negative-edge-triggered, maskable interrupt request input $\overline{\text{IRQC}}$ during normal instruction processing. MODA, MODB, MODC, and MODD select one of sixteen initial chip operating modes, latched into the OMR when the $\overline{\text{RESET}}$ signal is deasserted.
$\overline{\text{IRQC}}$	Input		**External Interrupt Request C**—$\overline{\text{IRQC}}$ is an active-low Schmitt-trigger input, internally synchronized to CLKOUT. If $\overline{\text{IRQC}}$ is asserted synchronous to CLKOUT, multiple processors can be re-synchronized using the WAIT instruction and asserting $\overline{\text{IRQC}}$ to exit the Wait state. If the processor is in the Stop standby state and $\overline{\text{IRQC}}$ is asserted, the processor will exit the Stop state. These inputs are 5 V tolerant.

Table 1-9 Interrupt and Mode Control (Continued)

Signal Name	Type	State During Reset	Signal Description
MODD	Input	Input	**Mode Select D**—MODD selects the initial chip operating mode during hardware reset and becomes a level-sensitive or negative-edge-triggered, maskable interrupt request input $\overline{IRQD}$ during normal instruction processing. MODA, MODB, MODC, and MODD select one of sixteen initial chip operating modes, latched into the OMR when the $\overline{RESET}$ signal is deasserted.
$\overline{IRQD}$	Input		**External Interrupt Request D**—$\overline{IRQD}$ is an active-low Schmitt-trigger input, internally synchronized to CLKOUT. If $\overline{IRQD}$ is asserted synchronous to CLKOUT, multiple processors can be re-synchronized using the WAIT instruction and asserting $\overline{IRQD}$ to exit the Wait state. If the processor is in the Stop standby state and $\overline{IRQD}$ is asserted, the processor will exit the Stop state. These inputs are 5 V tolerant.

HOST INTERFACE (HI32)

The Host Interface (HI32) provides a fast parallel data to 32-bit port, which may be connected directly to the host bus.

The HI32 supports a variety of standard buses, and provides a glueless connection to a PCI bus and a number of industry-standard microcomputers, microprocessors, DSPs, and DMA hardware.

Host Port Usage Considerations

Careful synchronization is required when reading multiple-bit registers that are written by another asynchronous system. This is a common problem when two asynchronous systems are connected (as they are in the Host port). The considerations for proper operation are discussed in the following table:

Table 1-**10**   Host Port Usage Considerations

Action	Description
Asynchronous read of receive byte registers	When reading the receive byte registers, Receive register High (RXH), Receive register Middle (RXM), or Receive register Low (RXL), the host interface programmer should use interrupts or poll the Receive register Data Full (RXDF) flag which indicates that data is available. This assures that the data in the receive byte registers will be valid.
Asynchronous write to transmit byte registers	The host interface programmer should not write to the transmit byte registers, Transmit register High (TXH), Transmit register Middle (TXM), or Transmit register Low (TXL), unless the Transmit register Data Empty (TXDE) bit is set indicating that the transmit byte registers are empty. This guarantees that the transmit byte registers will transfer valid data to the Host Receive (HRX) register.
Asynchronous write to host vector	The host interface programmer should change the Host Vector (HV) register only when the Host Command bit (HC) is clear. This will guarantee that the DSP interrupt control logic will receive a stable vector.

Host Port Configuration

The functions of the signals associated with the HI32 vary according to the programmed configuration of the interface as determined by the 24-bit DSP Control Register (DCTR). Refer to the *DSP56305 User's Manual* for detailed descriptions of this and the other configuration registers used with the HI32.

Table 1-11 Host Interface

Signal Name	Type	State During Reset	Signal Description
HAD0–HAD7	Input/ Output	Tri-stated	**Host Address/Data 0**–**7**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, these signals are lines 0–7 of the bidirectional, multiplexed Address/Data bus.
HA3–HA10	Input		**Host Address 3**–**10**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, these signals are lines 3–10 of the input Address bus.
PB0–PB7	Input or Output		**Port B 0**–**7**—When the HI32 is configured as GPIO through the DCTR, these signals are individually programmed as inputs or outputs through the HI32 Data Direction Register (DIRH). These inputs are 5 V tolerant.
HAD8–HAD15	Input/ Output	Tri-stated	**Host Address/Data 8**–**15**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, these signals are lines 8–15 of the bidirectional, multiplexed Address/Data bus.
HD0–HD7	Input/ Output		**Host Data 0**–**7**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, these signals are lines 0–7 of the bidirectional Data bus.
PB8–PB15	Input or Output		**Port B 8**–**15**—When the HI32 is configured as GPIO through the DCTR, these signals are individually programmed as inputs or outputs through the HI32 DIRH. These inputs are 5 V tolerant.

Table 1-11   Host Interface (Continued)

Signal Name	Type	State During Reset	Signal Description
HC0–HC3/ $\overline{\text{HBE0}}$–$\overline{\text{HBE3}}$	Input/ Output	Tri-stated	**Command 0–3/Byte Enable 0–3**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, these signals are lines 0–7 of the bidirectional, multiplexed Address/Data bus.
HA0–HA2	Input		**Host Address 0–2**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, these signals are lines 0–2 of the input Address bus. Note: The fourth signal in this set should be connected to a pull-up resistor or directly to V_{CC} when using a non-PCI bus.
PB16–PB19	Input or Output		**Port B 16–19**—When the HI32 is configured as GPIO through the DCTR, these signals are individually programmed as inputs or outputs through the HI32 DIRH. These inputs are 5 V tolerant.
$\overline{\text{HTRDY}}$	Input/ Output	Tri-stated	**Host Target Ready**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host Target Ready signal.
$\overline{\text{HDBEN}}$	Output		**Host Data Bus Enable**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is Host Data Bus Enable output.
PB20	Input or Output		**Port B 20**—When the HI32 is configured as GPIO through the DCTR, this signal is individually programmed as an input or output through the HI32 DIRH. This input is 5 V tolerant.
$\overline{\text{HIRDY}}$	Input/ Output	Tri-stated	**Host Initiator Ready**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host Initiator Ready signal.
$\overline{\text{HDBDR}}$	Output		**Host Data Bus Direction**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is Host Data Bus Direction output.
PB21	Input or Output		**Port B 21**—When the HI32 is configured as GPIO through the DCTR, this signal is individually programmed as an input or output through the HI32 DIRH. This input is 5 V tolerant.

Table 1-11 Host Interface (Continued)

Signal Name	Type	State During Reset	Signal Description
HDEVSEL	Input／Output	Tri-stated	**Host Device Select**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host Device Select signal.
$\overline{\text{HSAK}}$	Output		**Host Select Acknowledge**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is Host Select Acknowledge output.
PB22	Input or Output		**Port B 22**—When the HI32 is configured as GPIO through the DCTR, this signal is individually programmed as an input or output through the HI32 DIRH.

This input is 5 V tolerant. |
| $\overline{\text{HLOCK}}$ | Input／Output | Tri-stated | **Host Lock**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host Lock signal. |
| $\overline{\text{HBS}}$ | Input | | **Host Bus Strobe**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is Host Bus Strobe Schmitt-trigger input. |
| PB23 | Input or Output | | **Port B 23**—When the HI32 is configured as GPIO through the DCTR, this signal is individually programmed as an input or output through the HI32 DIRH.

This input is 5 V tolerant. |
| HPAR | Input／Output | Tri-stated | **Host Parity**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host Parity signal. |
| $\overline{\text{HDAK}}$ | Input | | **Host DMA Acknowledge**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is Host DMA Acknowledge Schmitt-trigger input.

Port B —When the HI32 is configured as GPIO through the DCTR, this signal is internally disconnected.

This input is 5 V tolerant. |

Table 1-11 Host Interface (Continued)

Signal Name	Type	State During Reset	Signal Description
HPERR	Input/ Output	Tri-stated	**Host Parity Error**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host Parity Error signal.
HDRQ	Output		**Host DMA Request**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is Host DMA Request output.
			Port B —When the HI32 is configured as GPIO through the DCTR, this signal is internally disconnected.
			This input is 5 V tolerant.
$\overline{\text{HGNT}}$	Input	Input	**Host Bus Grant**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host Bus Grant signal.
HAEN	Input		**Host Address Enable**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is Host Address Enable output.
			Port B —When the HI32 is configured as GPIO through the DCTR, this signal is internally disconnected.
			This input is 5 V tolerant.
$\overline{\text{HREQ}}$	Output	Tri-stated	**Host Bus Request**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host Bus Request signal.
HTA	Output		**Host Transfer Acknowledge**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is Host Data Bus Enable output.
			Port B —When the HI32 is configured as GPIO through the DCTR, this signal is internally disconnected.
			This input is 5 V tolerant.

Table 1-11   Host Interface (Continued)

Signal Name	Type	State During Reset	Signal Description
HSERR	Output, open drain	Tri-stated	**Host System Error**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host System Error signal.
$\overline{\text{HIRQ}}$	Output, open drain		**Host Interrupt Request**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is Host Interrupt Request output. **Port B**—When the HI32 is configured as GPIO through the DCTR, this signal is internally disconnected. This input is 5 V tolerant.
$\overline{\text{HSTOP}}$	Input/ Output	Tri-stated	**Host Stop**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host Stop signal.
$\overline{\text{HWR}}$/HRW	Input		**Host Write/Host Read-Write**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is Host Write/Host Read-Write Schmitt-trigger input. **Port B**—When the HI32 is configured as GPIO through the DCTR, this signal is internally disconnected. This input is 5 V tolerant.
HIDSEL	Input	Input	**Host Initialization Device Select**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host Initialization Device Select signal.
$\overline{\text{HRD}}$/$\overline{\text{HDS}}$	Input		**Host Read/Host Data Strobe**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is Host Data Read/Host Data Strobe Schmitt-trigger input. **Port B**—When the HI32 is configured as GPIO through the DCTR, this signal is internally disconnected. This input is 5 V tolerant.

Table 1-11 Host Interface (Continued)

Signal Name	Type	State During Reset	Signal Description
HFRAME	Input/ Output	Tri-stated	**Host Frame**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host cycle Frame signal. **Non-PCI bus**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal must be connected to a pull-up resistor or directly to V_{CC}. **Port B**—When the HI32 is configured as GPIO through the DCTR, this signal is internally disconnected. This input is 5 V tolerant.
HCLK	Input	Input	**Host Clock**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Host Bus Clock input. **Non-PCI bus**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal must be connected to a pull-up resistor or directly to V_{CC}. **Port B**—When the HI32 is configured as GPIO through the DCTR, this signal is internally disconnected. This input is 5 V tolerant.
HAD16–HAD31	Input/ Output	Tri-stated	**Host Address/Data 16–31**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, these signals are lines 16–31 of the bidirectional, multiplexed Address/Data bus.
HD8–HD23	Input/ Output		**Host Data 8–23**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, these signals are lines 8–23 of the bidirectional Data bus. **Port B**—When the HI32 is configured as GPIO through the DCTR, these signals are internally disconnected. These inputs are 5 V tolerant.

Table 1-11 Host Interface (Continued)

Signal Name	Type	State During Reset	Signal Description
HRST	Input	Tri-stated	**Hardware Reset**—When the HI32 is programmed to interface a PCI bus and the HI function is selected, this is the Hardware Reset input.
HRST	Input		**Hardware Reset**—When HI32 is programmed to interface a universal non-PCI bus and the HI function is selected, this signal is the Hardware Reset Schmitt-trigger input. **Port B**—When the HI32 is configured as GPIO through the DCTR, this signal is internally disconnected. This input is 5 V tolerant.
HINTA	Output, open drain	Tri-stated	**Host Interrupt A**—When the HI function is selected, this signal is the Interrupt A open-drain output. **Port B**—When the HI32 is configured as GPIO through the DCTR, this signal is internally disconnected. This input is 5 V tolerant.
PVCL	Input	Input	**PCI Voltage Clamp**—When the HI32 is programmed to interface a PCI bus and the HI function is selected and the PCI bus uses a 3 V signal environment, connect this pin to V_{CC} (3.3 V) to enable the high voltage clamping required by the PCI specifications. In all other cases, including a 5 V PCI signal environment, leave the input unconnected.

ENHANCED SYNCHRONOUS SERIAL INTERFACE 0 (ESSI0)

There are two synchronous serial interfaces (ESSI0 and ESSI1) that provide a full-duplex serial port for serial communication with a variety of serial devices, including one or more industry-standard codecs, other DSPs, microprocessors, and peripherals which implement the Motorola Serial Peripheral Interface (SPI).

Table 1-**12**   Enhanced Synchronous Serial Interface 0 (ESSI0)

Signal Name	Type	State During		Signal Description
		Reset	Stop	
SC00	Input or Output	Input	Disconnected	**Serial Control 0**—The function of SC00 is determined by the selection of either Synchronous or Asynchronous mode. For Asynchronous mode, this signal will be used for the receive clock I/O (Schmitt-trigger input). For Synchronous mode, this signal is used either for Transmitter 1 output or for Serial I/O Flag 0.
PC0				**Port C 0**—The default configuration following reset is GPIO input PC0. When configured as PC0, signal direction is controlled through the Port Directions Register (PRR0). The signal can be configured as ESSI signal SC00 through the Port Control Register (PCR0). This input is 5 V tolerant.
SC01	Input/ Output	Input	Disconnected	**Serial Control 1**—The function of this signal is determined by the selection of either Synchronous or Asynchronous mode. For Asynchronous mode, this signal is the receiver frame sync I/O. For Synchronous mode, this signal is used either for Transmitter 2 output or for Serial I/O Flag 1.
PC1	Input or Output			**Port C 1**—The default configuration following reset is GPIO input PC1. When configured as PC1, signal direction is controlled through PRR0. The signal can be configured as an ESSI signal SC01 through PCR0. This input is 5 V tolerant.

Table 1-12   Enhanced Synchronous Serial Interface 0 (ESSI0) (Continued)

Signal Name	Type	State During Reset	State During Stop	Signal Description
SC02	Input/ Output	Input	Disconnected	**Serial Control Signal 2**—SC02 is used for frame sync I/O. SC02 is the frame sync for both the transmitter and receiver in Synchronous mode, and for the transmitter only in Asynchronous mode. When configured as an output, this signal is the internally generated frame sync signal. When configured as an input, this signal receives an external frame sync signal for the transmitter (and the receiver in synchronous operation).
PC2	Input or Output			**Port C 2**—The default configuration following reset is GPIO input PC2. When configured as PC2, signal direction is controlled through PRR0. The signal can be configured as an ESSI signal SC02 through PCR0. This input is 5 V tolerant.
SCK0	Input/ Output	Input	Disconnected	**Serial Clock**—SCK0 is a bidirectional Schmitt-trigger input signal providing the serial bit rate clock for the ESSI interface. The SCK0 is a clock input or output used by both the transmitter and receiver in Synchronous modes, or by the transmitter in Asynchronous modes. Although an external serial clock can be independent of and asynchronous to the DSP system clock, it must exceed the minimum clock cycle time of 6 T (i.e., the system clock frequency must be at least three times the external ESSI clock frequency). The ESSI needs at least three DSP phases inside each half of the serial clock.
PC3	Input or Output			**Port C 3**—The default configuration following reset is GPIO input PC3. When configured as PC3, signal direction is controlled through PRR0. The signal can be configured as an ESSI signal SCK0 through PCR0. This input is 5 V tolerant.

Table 1-12 Enhanced Synchronous Serial Interface 0 (ESSI0) (Continued)

Signal Name	Type	State During		Signal Description
		Reset	**Stop**	
SRD0	Input/ Output	Input	Disconnected	**Serial Receive Data**—SRD0 receives serial data and transfers the data to the ESSI receive shift register. SRD0 is an input when data is being received.
PC4	Input or Output			**Port C 4**—The default configuration following reset is GPIO input PC4. When configured as PC4, signal direction is controlled through PRR0. The signal can be configured as an ESSI signal SRD0 through PCR0. This input is 5 V tolerant.
STD0	Input/ Output	Input	Disconnected	**Serial Transmit Data**—STD0 is used for transmitting data from the serial transmit shift register. STD0 is an output when data is being transmitted.
PC5	Input or Output			**Port C 5**—The default configuration following reset is GPIO input PC5. When configured as PC5, signal direction is controlled through PRR0. The signal can be configured as an ESSI signal STD0 through PCR0. This input is 5 V tolerant.

ENHANCED SYNCHRONOUS SERIAL INTERFACE 1 (ESSI1)

Table 1-13 Enhanced Synchronous Serial Interface 1 (ESSI1)

Signal Name	Type	State During		Signal Description
		Reset	**Stop**	
SC10	Input or Output	Input	Disconnected	**Serial Control 0**—The function of SC10 is determined by the selection of either Synchronous or Asynchronous mode. For Asynchronous mode, this signal will be used for the receive clock I/O (Schmitt-trigger input). For Synchronous mode, this signal is used either for Transmitter 1 output or for Serial I/O Flag 0.
PD0				**Port D 0**—The default configuration following reset is GPIO input PD0. When configured as PD0, signal direction is controlled through the Port Directions Register (PRR1). The signal can be configured as an ESSI signal SC10 through the Port Control Register (PCR1). This input is 5 V tolerant.
SC11	Input/ Output	Input	Disconnected	**Serial Control 1**—The function of this signal is determined by the selection of either Synchronous or Asynchronous mode. For Asynchronous mode, this signal is the receiver frame sync I/O. For Synchronous mode, this signal is used either for Transmitter 2 output or for Serial I/O Flag 1.
PD1	Input or Output			**Port D 1**—The default configuration following reset is GPIO input PD1. When configured as PD1, signal direction is controlled through PRR1. The signal can be configured as an ESSI signal SC11 through PCR1. This input is 5 V tolerant.

Table 1-13 Enhanced Synchronous Serial Interface 1 (ESSI1) (Continued)

Signal Name	Type	State During		Signal Description
		Reset	**Stop**	
SC12	Input/ Output	Input	Disconnected	**Serial Control Signal 2**—SC12 is used for frame sync I/O. SC12 is the frame sync for both the transmitter and receiver in Synchronous mode, and for the transmitter only in Asynchronous mode. When configured as an output, this signal is the internally generated frame sync signal. When configured as an input, this signal receives an external frame sync signal for the transmitter (and the receiver in Synchronous operation).
PD2	Input or Output			**Port D 2**—The default configuration following reset is GPIO input PD2. When configured as PD2, signal direction is controlled through PRR1. The signal can be configured as an ESSI signal SC12 through PCR1. This input is 5 V tolerant.
SCK1	Input/ Output	Input	Disconnected	**Serial Clock**—SCK1 is a bidirectional Schmitt-trigger input signal providing the serial bit rate clock for the ESSI interface. The SCK1 is a clock input or output used by both the transmitter and receiver in Synchronous modes, or by the transmitter in Asynchronous modes.

Although an external serial clock can be independent of and asynchronous to the DSP system clock, it must exceed the minimum clock cycle time of 6 T (i.e., the system clock frequency must be at least three times the external ESSI clock frequency). The ESSI needs at least three DSP phases inside each half of the serial clock. |
| PD3 | Input or Output | | | **Port D 3**—The default configuration following reset is GPIO input PD3. When configured as PD3, signal direction is controlled through PRR1. The signal can be configured as an ESSI signal SCK1 through PCR1.

This input is 5 V tolerant. |

Table 1-13 Enhanced Synchronous Serial Interface 1 (ESSI1) (Continued)

Signal Name	Type	State During		Signal Description
		Reset	Stop	
SRD1	Input/ Output	Input	Disconnected	**Serial Receive Data**—SRD1 receives serial data and transfers the data to the ESSI receive shift register. SRD1 is an input when data is being received.
PD4	Input or Output			**Port D 4**—The default configuration following reset is GPIO input PD4. When configured as PD4, signal direction is controlled through PRR1. The signal can be configured as an ESSI signal SRD1 through PCR1. This input is 5 V tolerant.
STD1	Input/ Output	Input	Disconnected	**Serial Transmit Data**—STD1 is used for transmitting data from the serial transmit shift register. STD1 is an output when data is being transmitted.
PD5	Input or Output			**Port D 5**—The default configuration following reset is GPIO input PD5. When configured as PD5, signal direction is controlled through PRR1. The signal can be configured as an ESSI signal STD1 through PCR1. This input is 5 V tolerant.

SERIAL COMMUNICATION INTERFACE (SCI)

The Serial Communication interface (SCI) provides a full duplex port for serial communication to other DSPs, microprocessors, or peripherals, such as modems.

Table 1-14   Serial Communication Interface (SCI)

Signal Name	Type	State During Reset	State During Stop	Signal Description
RXD	Input	Input	Disconnected	**Serial Receive Data**—This input receives byte oriented serial data and transfers it to the SCI receive shift register.
PE0	Input or Output			**Port E 0**—The default configuration following reset is GPIO input PE0. When configured as PE0, signal direction is controlled through the SCI Port Directions Register (PRR). The signal can be configured as an SCI signal RXD through the SCI Port Control Register (PCR). This input is 5 V tolerant.
TXD	Output	Input	Disconnected	**Serial Transmit Data**—This signal transmits data from SCI transmit data register.
PE1	Input or Output			**Port E 1**—The default configuration following reset is GPIO input PE1. When configured as PE1, signal direction is controlled through the SCI PRR. The signal can be configured as an SCI signal TXD through the SCI PCR. This input is 5 V tolerant.
SCLK	Input/ Output	Input	Disconnected	**Serial Clock**—This is the bidirectional Schmitt-trigger input signal providing the input or output clock used by the transmitter and/or the receiver.
PE2	Input or Output			**Port E 2**—The default configuration following reset is GPIO input PE2. When configured as PE2, signal direction is controlled through the SCI PRR. The signal can be configured as an SCI signal SCLK through the SCI PCR. This input is 5 V tolerant.

TIMERS

Three identical and independent timers are implemented in the DSP56305. Each timer can use internal or external clocking, and can interrupt the DSP56305 after a specified number of events (clocks), or can signal an external device after counting a specific number of internal events.

Table 1-15 Triple Timer Signals

Signal Name	Type	State During		Signal Description
		Reset	Stop	
TIO0	Input or Output	Input	Disconnected	**Timer 0 Schmitt-Trigger Input/Output**—When Timer 0 functions as an external event counter or in Measurement mode, TIO0 is used as input. When Timer 0 functions in Watchdog, Timer, or Pulse Modulation mode, TIO0 is used as output. The default mode after reset is GPIO input. This can be changed to output or configured as a Timer Input/Output through the Timer 0 Control/Status Register (TCSR0). This input is 5 V tolerant.
TIO1	Input or Output	Input	Disconnected	**Timer 1 Schmitt-Trigger Input/Output**—When Timer 1 functions as an external event counter or in Measurement mode, TIO1 is used as input. When Timer 1 functions in Watchdog, Timer, or Pulse Modulation mode, TIO1 is used as output. The default mode after reset is GPIO input. This can be changed to output or configured as a Timer Input/Output through the Timer 1 Control/Status Register (TCSR1). This input is 5 V tolerant.
TIO2	Input or Output	Input	Disconnected	**Timer 2 Schmitt-Trigger Input/Output**—When Timer 2 functions as an external event counter or in Measurement mode, TIO2 is used as input. When Timer 2 functions in Watchdog, Timer, or Pulse Modulation mode, TIO2 is used as output. The default mode after reset is GPIO input. This can be changed to output or configured as a Timer Input/Output through the Timer 2 Control/Status Register (TCSR2). This input is 5 V tolerant.

JTAG/ONCE INTERFACE

Table 1-16 JTAG/OnCE Interface

Signal Name	Type	State During Reset	Signal Description
TCK	Input	Input	**Test Clock**—TCK is a test clock input signal used to synchronize the JTAG test logic. This input is 5 V tolerant.
TDI	Input	Input	**Test Data Input**—TDI is a test data serial input signal used for test instructions and data. TDI is sampled on the rising edge of TCK and has an internal pull-up resistor. This input is 5 V tolerant.
TDO	Output	Tri-stated	**Test Data Output**—TDO is a test data serial output signal used for test instructions and data. TDO is tri-statable and is actively driven in the shift-IR and shift-DR controller states. TDO changes on the falling edge of TCK.
TMS	Input	Input	**Test Mode Select**—TMS is an input signal used to sequence the test controller's state machine. TMS is sampled on the rising edge of TCK and has an internal pull-up resistor. This input is 5 V tolerant.
$\overline{\text{TRST}}$	Input	Input	**Test Reset**—$\overline{\text{TRST}}$ is an active-low Schmitt-trigger input signal used to asynchronously initialize the test controller. $\overline{\text{TRST}}$ has an internal pull-up resistor. $\overline{\text{TRST}}$ must be asserted after power up. Always assert $\overline{\text{TRST}}$ immediately after power-up. This input is 5 V tolerant.

Table 1-16 JTAG/OnCE Interface (Continued)

Signal Name	Type	State During Reset	Signal Description
DE	Input/Output	Input	**Debug Event**—DE is an open-drain bidirectional active-low signal providing, as an input, a means of entering the Debug mode of operation from an external command controller, and, as an output, a means of acknowledging that the chip has entered the Debug mode. This signal, when asserted as an input, causes the DSP56300 core to finish the current instruction being executed, save the instruction pipeline information, enter the Debug mode, and wait for commands to be entered from the debug serial input line. This signal is asserted as an output for three clock cycles when the chip enters the Debug mode as a result of a debug request or as a result of meeting a breakpoint condition. The $\overline{DE}$ has an internal pull-up resistor.
			This is not a standard part of the JTAG Test Access Port (TAP) Controller. The signal connects directly to the OnCE module to initiate Debug mode directly or to provide a direct external indication that the chip has entered the Debug mode. All other interface with the OnCE module must occur through the JTAG port.
			This input is 5 V tolerant.

PRELIMINARY

SECTION 2

SPECIFICATIONS

INTRODUCTION

The DSP56305 is fabricated in high density CMOS with Transistor-Transistor Logic (TTL) compatible inputs and outputs. The DSP56305 specifications are preliminary and are from design simulations, and may not be fully tested or guaranteed at this early stage of the product life cycle. Finalized specifications will be published after full characterization and device qualifications are complete.

MAXIMUM RATINGS

CAUTION

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, normal precautions should be taken to avoid exceeding maximum voltage ratings. Reliability is enhanced if unused inputs are tied to an appropriate logic voltage level (e.g., either GND or V$_{CC}$).

Note: In the calculation of timing requirements, adding a maximum value of one specification to a minimum value of another specification does not yield a reasonable sum. A maximum specification is calculated using a worst case variation of process parameter values in one direction. The minimum specification is calculated using the worst case for the same parameters in the opposite direction. Therefore, a "maximum" value for a specification will never occur in the same device that has a "minimum" value for another specification; adding a maximum to a minimum represents a condition that can never exist.

Table 2-1 Maximum Ratings

Rating[1]	Symbol	Value[1, 2]	Unit
Supply Voltage	V_{CC}	-0.3 to $+4.0$	V
All input voltages excluding "5 V tolerant" inputs[3]	V_{IN}	GND $-$ 0.3 to V_{CC} + 0.3	V
All "5 V tolerant" input voltages[3]	V_{IN5}	GND $-$ 0.3 to V_{CC} + 3.95	V
Current drain per pin excluding V_{CC} and GND	I	10	mA
Operating temperature range	T_J	-40 to $+100$	°C
Storage temperature	T_{STG}	-55 to $+150$	°C

Note: 1.   GND = 0 V, V_{CC} = 3.3 V ± 0.3 V, T_J = –40°C to +100°C, CL = 50 pF + 2 TTL Loads
2.   Absolute maximum ratings are stress ratings only, and functional operation at the maximum is not guaranteed. Stress beyond the maximum rating may affect device reliability or cause permanent damage to the device.
3.   **CAUTION**: All "5 V Tolerant" input voltages can not be more than 3.95 V greater than the supply voltage; this restriction applies to "power on", as well as during normal operation.
"5 V Tolerant" inputs are inputs that tolerate 5 V.

THERMAL CHARACTERISTICS

Table 2-2 Thermal Characteristics

Characteristic	Symbol	PBGA[3] Value	Unit
Junction-to-ambient thermal resistance	$R_{\theta JA}$ or θ_{JA}	50	°C/W
Junction-to-case thermal resistance	$R_{\theta JC}$ or θ_{JC}	9	°C/W
Thermal characterization parameter	Ψ_{JT}	5	°C/W

Note: 1.   Junction-to-ambient thermal resistance is based on measurements on a horizontal single sided printed circuit board per SEMI G38-87 in natural convection.(SEMI is Semiconductor Equipment and Materials International, 805 East Middlefield Rd., Mountain View, CA 94043, (415) 964-5111)
2.   Junction-to-case thermal resistance is based on measurements using a cold plate per SEMI G30-88, with the exception that the cold plate temperature is used for the case temperature.
3.   Estimated values; testing not complete

DC ELECTRICAL CHARACTERISTICS

Table 2-3 DC Electrical Characteristics[6]

Characteristics	Symbol	Min	Typ	Max	Unit
Supply voltage	V_{CC}	3.0	3.3	3.6	V
Input high voltage • D0–D23, $\overline{BG}$, $\overline{BB}$, $\overline{TA}$	V_{IH}	2.0	—	V_{CC}	V
• MOD[1]/$\overline{IRQ}$[1], $\overline{RESET}$, PINIT/ $\overline{NMI}$ and all JTAG/ESSI/SCI/ Timer/HI32 pins	V_{IHP}	2.0	—	$V_{CC} + 3.95$	V
• EXTAL[8]	V_{IHX}	$0.8 \times V_{CC}$	—	V_{CC}	V
Input low voltage • D0–D23, $\overline{BG}$, $\overline{BB}$, $\overline{TA}$, MOD[1]/ $\overline{IRQ}$[1], $\overline{RESET}$, PINIT	V_{IL}	– 0.3	—	0.8	V V
• All JTAG/ESSI/SCI/Timer/ HI08 pins	V_{ILP}	– 0.3	—	0.8	V
• EXTAL[8]	V_{ILX}	– 0.3	—	$0.2 \times V_{CC}$	V
Input leakage current	I_{IN}	– 10	—	10	μA
High impedance (off-state) input current (@ 2.4 V / 0.4 V)	I_{TSI}	– 10	—	10	μA
Output high voltage • TTL (I_{OH} = –0.4 mA)[5,7]	V_{OH}	V_{CC} – 0.4	—	—	V
• CMOS (I_{OH} = –10 μA)[5]		V_{CC} – 0.01	—	—	V
Output low voltage • TTL (I_{OL} = 3.0 mA, open-drain pins I_{OL} = 6.7 mA)[5,7]	V_{OL}	—	—	0.4	V
• CMOS (I_{OL} = 10 μA)[5]		—	—	0.01	V
Internal supply current[2]: • In Normal mode	I_{CCI}	—	102	145	mA
• In Wait mode[3]	I_{CCW}	—	6	9	mA
• In Stop mode[4]	I_{CCS}	—	100	150	μA
PLL supply current in Stop mode[5]		—	1	2.5	mA
Input capacitance[5]	C_{IN}	—	—	10	pF

Table 2-3 DC Electrical Characteristics[6] (Continued)

Characteristics	Symbol	Min	Typ	Max	Unit

Note:
1. Refers to MODA/$\overline{\text{IRQA}}$, MODB/$\overline{\text{IRQB}}$, MODC/$\overline{\text{IRQC}}$, and MODD/$\overline{\text{IRQD}}$ pins
2. **Power Consumption Considerations** on page 4-4 provides a formula to compute the estimated current requirements in Normal mode. In order to obtain these results, all inputs must be terminated (i.e., not allowed to float). Measurements are based on synthetic intensive DSP benchmarks (see **Appendix A**). The power consumption numbers in this specification are 90% of the measured results of this benchmark. This reflects typical DSP applications. Typical internal supply current is measured with $V_{CC} = 3.0$ V at $T_J = 100°$C. Maximum internal supply current is measured with $V_{CC} = 3.6$ V at $T_J = 100°$C.
3. In order to obtain these results, all inputs must be terminated (i.e., not allowed to float). PLL and XTAL signals are disabled during Stop state.
4. In order to obtain these results, all inputs, which are not disconnected at Stop mode, must be terminated (i.e., not allowed to float).
5. Periodically sampled and not 100% tested
6. $V_{CC} = 3.3$ V $\pm$ 0.3 V; $T_J = -40°$C to $+100$ °C, $C_L = 50$ pF + 2 TTL Loads
7. This characteristic does not apply to XTAL and PCAP.
8. Driving EXTAL to the low V_{IHX} or the high V_{ILX} value may cause additional power consumption (DC current). To minimize power consumption, the minimum V_{IHX} should be no lower than $0.9 \times V_{CC}$ and the maximum V_{ILX} should be no higher than $0.1 \times V_{CC}$.

AC ELECTRICAL CHARACTERISTICS

The timing waveforms shown in the AC electrical characteristics section are tested with a V_{IL} maximum of 0.3 V and a V_{IH} minimum of 2.4 V for all pins except EXTAL, which is tested using the input levels shown in **Note 6** of the previous table. AC timing specifications, which are referenced to a device input signal, are measured in production with respect to the 50% point of the respective input signal's transition. DSP56305 output levels are measured with the production test machine V_{OL} and V_{OH} reference levels set at 0.8 V and 2.0 V, respectively.

INTERNAL CLOCKS

Table 2-4 Internal Clocks, CLKOUT

Characteristics	Symbol	Expression[1, 2]		
		Min	**Typ**	**Max**
Internal operation frequency and CLKOUT with PLL enabled	f	—	$(Ef \times MF)/(PDF \times DF)$	—
Internal operation frequency and CLKOUT with PLL disabled	f	—	$Ef/2$	—
Internal clock and CLKOUT high period • With PLL disabled • With PLL enabled and MF ≤ 4 • With PLL enabled and MF > 4	T_H	— $0.49 \times ET_C \times PDF \times DF/MF$ $0.47 \times ET_C \times PDF \times DF/MF$	ET_C — —	— $0.51 \times ET_C \times PDF \times DF/MF$ $0.53 \times ET_C \times PDF \times DF/MF$
Internal clock and CLKOUT low period • With PLL disabled • With PLL enabled and MF ≤ 4 • With PLL enabled and MF > 4	T_L	— $0.49 \times ET_C \times PDF \times DF/MF$ $0.47 \times ET_C \times PDF \times DF/MF$	ET_C — —	— $0.51 \times ET_C \times PDF \times DF/MF$ $0.53 \times ET_C \times PDF \times DF/MF$
Internal clock and CLKOUT cycle time with PLL enabled	T_C	—	$ET_C \times PDF \times DF/MF$	—
Internal clock and CLKOUT cycle time with PLL disabled	T_C	—	$2 \times ET_C$	—
Instruction cycle time	I_{CYC}	—	T_C	—

Note: 1. DF = Division Factor
Ef = External frequency
ET_C = External clock cycle
MF = Multiplication Factor
PDF = Predivision Factor
T_C = internal clock cycle
2. See the **PLL and Clock Generation** section in the *DSP56300 Family Manual* for a detailed discussion of the PLL.

EXTERNAL CLOCK OPERATION

The DSP56305 system clock may be derived from the on–chip crystal oscillator, as shown on the cover page, or it may be externally supplied. An externally supplied square wave voltage source should be connected to EXTAL, leaving XTAL not connected physically to the board or socket (See **Figure 2-2**.).

**Fundamental Frequency
Fork Crystal Oscillator**
Suggested Component Values:

f_{OSC} = 32.768 kHz
R1 = 3.9 MΩ ± 10%
C = 22 pF ± 20%
R2 = 200 kΩ ± 10%

Calculations were done for a 32.768 kHz crystal with the following parameters:
a load capacitance (C_L) of 12.5 pF,
a shunt capacitance (C_0) of 1.8 pF,
a series resistance of 40 kΩ, and
a drive level of 1 μW.

**Fundamental Frequency
Crystal Oscillator**
Suggested Component Values:

f_{OSC} = 4 MHz f_{OSC} = 20 MHz
R = 680 kΩ ± 10%   R = 680 kΩ ± 10%
C = 56 pF ± 20%   C = 22 pF ± 20%

Calculations were done for a 4/20 MHz crystal with the following parameters:
a C_L of 30/20 pF,
a C_0 of 7/6 pF,
a series resistance of 100/20 Ω, and
a drive level of 2 mW.

Figure 2-1 Crystal Oscillator Circuits

Figure 2-2 External Clock Timing

Note: The midpoint is 0.5 (V_{IHC} + V_{ILC}).

AA0459

Table 2-5 Clock Operation

No.	Characteristics	Symbol	80 MHz	
			Min	Max
1	Frequency of EXTAL (EXTAL Pin Frequency) **The rise and fall time of the external clock should be 3 ns maximum.**	Ef	0	80.0
2	EXTAL input high[1,2] • With PLL disabled (46.7%–53.3% duty cycle) • With PLL enabled (42.5%–57.5% duty cycle)	ET_H	5.84 ns 5.31 ns	∞ 157.0 μs
3	EXTAL input low[1,2] • With PLL disabled (46.7%–53.3% duty cycle) • With PLL enabled (42.5%–57.5% duty cycle)	ET_L	5.84 ns 5.31 ns	∞ 157.0 μs
4	EXTAL cycle time[2] • With PLL disabled • With PLL enabled	ET_C	12.50 ns 12.50 ns	∞ 273.1 μs
5	CLKOUT change from EXTAL fall with PLL disabled		4.3 ns	11.0 ns
6	CLKOUT from EXTAL with PLL enabled[3,5] a. MF = 1, PDF = 1, Ef > 15 MHz b. MF = 2 or 4, PDF = 1, Ef > 15 MHz, or, MF ≤ 4, PDF ≠ 1, Ef / PDF > 15 MHz		0.0 ns 0.0 ns	1.8 ns 1.8 ns

Table 2-5 Clock Operation (Continued)

No.	Characteristics	Symbol	80 MHz	
			Min	**Max**
7	Instruction cycle time = I_{CYC} = T_C[4] (See **Table 2-4**.) (46.7%–53.3% duty cycle) • With PLL disabled • With PLL enabled	I_{CYC}	25.0 ns 12.50 ns	∞ 8.53 μs

Note:
1. Measured at 50% of the input transition
2. The maximum value for PLL enabled is given for minimum V_{CO} and maximum MF.
3. Periodically sampled and not 100% tested
4. The maximum value for PLL enabled is given for minimum V_{CO} and maximum DF.
5. The skew is not guaranteed for any other MF value.
6. The indicated duty cycle is for the specified maximum frequency for which a part is rated. The minimum clock high or low time required for correction operation, however, remains the same at lower operating frequencies; therefore, when a lower clock frequency is used, the signal symmetry may vary from the specified duty cycle as long as the minimum high time and low time requirements are met.

PHASE LOCK LOOP (PLL) CHARACTERISTICS

Table 2-6 PLL Characteristics

Characteristics	80 MHz		Unit
	Min	**Max**	
V_{CO} frequency when PLL enabled ($MF \times E_f \times 2 / PDF$)	30	160	MHz
PLL external capacitor (PCAP pin to V_{CCP}) (C_{PCAP}[1]) • @ MF ≤ 4 • @ MF > 4	$(MF \times 425) - 125$ $MF \times 520$	$(MF \times 590) - 175$ $MF \times 920$	pF pF

Note: C_{PCAP} is the value of the PLL capacitor (connected between the PCAP pin and V_{CCP}). The recommended value in pF for C_{PCAP} can be computed from one of the following equations:

$(500 \times MF) - 150$, for MF ≤ 4, or

$690 \times MF$, for MF > 4.

RESET, STOP, MODE SELECT, AND INTERRUPT TIMING

Table 2-7   Reset, Stop, Mode Select, and Interrupt Timing[6]

	• Minimum	$9.25 \times T_C + 1.0$	116.6	—	ns
	• Maximum	$24.75 \times T_C + 5.0$	—	314.4	ns
24	Duration for $\overline{IRQA}$ assertion to recover from Stop state		7.4	—	ns
25	Delay from $\overline{IRQA}$ assertion to fetch of first instruction (when exiting Stop)[2, 3]				
	• PLL is not active during Stop (PCTL Bit 17 = 0) and Stop delay is enabled (OMR Bit 6 = 0)	$PLC \times ET_C \times PDF + (128 K - PLC/2) \times T_C$	1.6	17.0	ms
	• PLL is not active during Stop (PCTL Bit 17 = 0) and Stop delay is not enabled (OMR Bit 6 = 1)	$PLC \times ET_C \times PDF + (23.75 \pm 0.5) \times T_C$	290.6 ns	15.4 ms	
	• PLL is active during Stop (PCTL Bit 17 = 1) (Implies No Stop Delay)	$(8.25 \pm 0.5) \times T_C$	96.9	109.4	ns

Table 2-7   Reset, Stop, Mode Select, and Interrupt Timing[6] (Continued)

No.	Characteristics	Expression	80 MHz		Unit
			Min	**Max**	
26	Duration of level sensitive $\overline{\text{IRQA}}$ assertion to ensure interrupt service (when exiting Stop)[2, 3]				
	• PLL is not active during Stop (PCTL Bit 17 = 0) and Stop delay is enabled (OMR Bit 6 = 0)	$\text{PLC} \times \text{ET}_C \times \text{PDF} + (128\text{K} - \text{PLC}/2) \times T_C$	17.0	—	ms
	• PLL is not active during Stop (PCTL Bit 17 = 0) and Stop delay is not enabled (OMR Bit 6 = 1)	$\text{PLC} \times \text{ET}_C \times \text{PDF} + (20.5 \pm 0.5) \times T_C$	15.4	—	ms
	• PLL is active during Stop (PCTL Bit 17 = 1) (implies no Stop delay)	$5.5 \times T_C$	68.8	—	ns
27	Interrupt Requests Rate				
	• HI08, ESSI, SCI, Timer	$12T_C$	—	150.0	ns
	• DMA	$8T_C$	—	100.0	ns
	• $\overline{\text{IRQ}}$, $\overline{\text{NMI}}$ (edge trigger)	$8T_C$	—	100.0	ns
	• $\overline{\text{IRQ}}$, $\overline{\text{NMI}}$ (level trigger)	$12T_C$	—	150.0	ns
28	DMA Requests Rate				
	• Data read from HI08, ESSI, SCI	$6T_C$	—	75.0	ns
	• Data write to HI08, ESSI, SCI	$7T_C$	—	87.5	ns
	• Timer	$2T_C$	—	25.0	ns
	• $\overline{\text{IRQ}}$, $\overline{\text{NMI}}$ (edge trigger)	$3T_C$	—	37.5	ns
29	Delay from $\overline{\text{IRQA}}$, $\overline{\text{IRQB}}$, $\overline{\text{IRQC}}$, $\overline{\text{IRQD}}$, $\overline{\text{NMI}}$ assertion to external memory (DMA source) access address out valid	$4.25 \times T_C + 2.0$	55.1	—	ns

Note: 1.   When using fast interrupts and $\overline{\text{IRQA}}$, $\overline{\text{IRQB}}$, $\overline{\text{IRQC}}$, and $\overline{\text{IRQD}}$ are defined as level-sensitive, timings 19 through 21 apply to prevent multiple interrupt service. To avoid these timing restrictions, the deasserted Edge-Triggered mode is recommended when using fast interrupts. Long interrupts are recommended when using Level-Sensitive mode.

Table 2-7   Reset, Stop, Mode Select, and Interrupt Timing[6] (Continued)

No.	Characteristics	Expression	80 MHz Min	80 MHz Max	Unit

2.   This timing depends on several settings:

For PLL disable, using internal oscillator (PLL Control Register (PCTL) Bit 16 = 0) and oscillator disabled during Stop (PCTL Bit 17 = 0), a stabilization delay is required to assure the oscillator is stable before executing programs. In that case, resetting the Stop delay (OMR Bit 6 = 0) will provide the proper delay. While it is possible to set OMR Bit 6 = 1, it is not recommended and these specifications do not guarantee timings for that case.

For PLL disable, using internal oscillator (PCTL Bit 16 = 0) and oscillator enabled during Stop (PCTL Bit 17=1), no stabilization delay is required and recovery time will be minimal (OMR Bit 6 setting is ignored).

For PLL disable, using external clock (PCTL Bit 16 = 1), no stabilization delay is required and recovery time will be defined by the PCTL Bit 17 and OMR Bit 6 settings.

For PLL enable, if PCTL Bit 17 is 0, the PLL is shutdown during Stop. Recovering from Stop requires the PLL to get locked. The PLL lock procedure duration, PLL Lock Cycles (PLC), may be in the range of 0 to 1000 cycles. This procedure occurs in parallel with the stop delay counter, and stop recovery will end when the last of these two events occurs. The stop delay counter completes count or PLL lock procedure completion.

PLC value for PLL disable is 0.

The maximum value for ET_C is 4096 (maximum MF) divided by the desired internal frequency (i.e., for 66 MHz it is 4096/66 MHz = 62 μs). During the stabilization period, T_C, T_H, and T_L will not be constant, and their width may vary, so timing may vary as well.

3.   Periodically sampled and not 100% tested

4.   For an external clock generator, $\overline{RESET}$ duration is measured during the time in which $\overline{RESET}$ is asserted, V_{CC} is valid, and the EXTAL input is active and valid.

For internal oscillator, $\overline{RESET}$ duration is measured during the time in which $\overline{RESET}$ is asserted and V_{CC} is valid. The specified timing reflects the crystal oscillator stabilization time after power-up. This number is affected both by the specifications of the crystal and other components connected to the oscillator and reflects worst case conditions.

When the V_{CC} is valid, but the other "required $\overline{RESET}$ duration" conditions (as specified above) have not been yet met, the device circuitry will be in an uninitialized state that can result in significant power consumption and heat-up. Designs should minimize this state to the shortest possible duration.

5.   If PLL does not lose lock

6. V_{CC} = 3.3 V ± 0.3 V; T_J = –40°C to +100°C, C_L = 50 pF + 2 TTL Loads

7.   WS = number of wait states (measured in clock cycles, number of T_C)

8.   Use expression to compute maximum value.

Table 2-10 DRAM Page Mode Timings, One Wait State (Low-Power Applications)[1, 2, 3]

No.	Characteristics	Symbol	Expression	20 MHz[6] Min	20 MHz[6] Max	30 MHz[6] Min	30 MHz[6] Max	Unit
155	$\overline{WR}$ assertion to data active		$0.75 \times T_C - 0.3$	37.2	—	24.7	—	ns
156	$\overline{WR}$ deassertion to data high impedance		$0.25 \times T_C$	—	12.5	—	8.3	ns

Note:
1. The number of wait states for page mode access is specified in the DCR.
2. The refresh period is specified in the DCR.
3. All the timings are calculated for the worst case. Some of the timings are better for specific cases (e.g., t_{PC} equals $2 \times T_C$ for read-after-read or write-after-write sequences).
4. BRW[1:0] (DRAM control register bits) defines the number of wait states that should be inserted in each DRAM out-of-page access.
5. $\overline{RD}$ deassertion will always occur after $\overline{CAS}$ deassertion; therefore, the restricted timing is t_{OFF} and not t_{GZ}.
6. Reduced DSP clock speed allows use of Page Mode DRAM with one Wait state (See **Figure 2-16**.).

156	$\overline{WR}$ deassertion to data high impedance		$0.25 \times T_C$	—	3.1	ns

Note:
1. The number of wait states for Page mode access is specified in the DCR.
2. The refresh period is specified in the DCR.
3. The asynchronous delays specified in the expressions are valid for DSP56305.
4. All the timings are calculated for the worst case. Some of the timings are better for specific cases (e.g., t_{PC} equals $3 \times T_C$ for read-after-read or write-after-write sequences).
5. BRW[1:0] (DRAM control register bits) defines the number of wait states that should be inserted in each DRAM out-of-page access.
6. $\overline{RD}$ deassertion will always occur after $\overline{CAS}$ deassertion; therefore, the restricted timing is t_{OFF} and not t_{GZ}.

195	$\overline{WR}$ deassertion to data high impedance		$0.25 \times T_C$	—	3.1	ns

Note:
1. The number of wait states for out-of-page access is specified in the DCR.
2. The refresh period is specified in the DCR.
3. The asynchronous delays specified in the expressions are valid for DSP56305.
4. $\overline{RD}$ deassertion will always occur after $\overline{CAS}$ deassertion; therefore, the restricted timing is t_{OFF} and not t_{GZ}.

Table 2-17 DRAM Out-of-Page and Refresh Timings, Fifteen Wait States[1, 2]

No.	Characteristics[3]	Symbol	Expression	80 MHz		Unit
				Min	**Max**	
157	Random read or write cycle time	t_{RC}	$16 \times T_C$	200.0	—	ns
158	$\overline{RAS}$ assertion to data valid (read)	t_{RAC}	$8.25 \times T_C - 6.5$	—	96.6	ns
159	$\overline{CAS}$ assertion to data valid (read)	t_{CAC}	$4.75 \times T_C - 6.5$	—	52.9	ns
160	Column address valid to data valid (read)	t_{AA}	$5.5 \times T_C - 6.5$	—	62.3	ns
161	$\overline{CAS}$ deassertion to data not valid (read hold time)	t_{OFF}	0.0	0.0	—	ns
162	$\overline{RAS}$ deassertion to $\overline{RAS}$ assertion	t_{RP}	$6.25 \times T_C - 4.0$	74.1	—	ns
163	$\overline{RAS}$ assertion pulse width	t_{RAS}	$9.75 \times T_C - 4.0$	117.9	—	ns
164	$\overline{CAS}$ assertion to $\overline{RAS}$ deassertion	t_{RSH}	$6.25 \times T_C - 4.0$	74.1	—	ns
165	$\overline{RAS}$ assertion to $\overline{CAS}$ deassertion	t_{CSH}	$8.25 \times T_C - 4.0$	99.1	—	ns
166	$\overline{CAS}$ assertion pulse width	t_{CAS}	$4.75 \times T_C - 4.0$	55.4	—	ns
167	$\overline{RAS}$ assertion to $\overline{CAS}$ assertion	t_{RCD}	$3.5 \times T_C \pm 2$	41.8	45.8	ns
168	$\overline{RAS}$ assertion to column address valid	t_{RAD}	$2.75 \times T_C \pm 2$	32.4	36.4	ns
169	$\overline{CAS}$ deassertion to $\overline{RAS}$ assertion	t_{CRP}	$7.75 \times T_C - 4.0$	92.9	—	ns
170	$\overline{CAS}$ deassertion pulse width	t_{CP}	$6.25 \times T_C - 4.0$	74.1	—	ns
171	Row address valid to $\overline{RAS}$ assertion	t_{ASR}	$6.25 \times T_C - 4.0$	74.1	—	ns
172	$\overline{RAS}$ assertion to row address not valid	t_{RAH}	$2.75 \times T_C - 4.0$	30.4	—	ns
173	Column address valid to $\overline{CAS}$ assertion	t_{ASC}	$0.75 \times T_C - 4.0$	5.4	—	ns
174	$\overline{CAS}$ assertion to column address not valid	t_{CAH}	$6.25 \times T_C - 4.0$	74.1	—	ns
175	$\overline{RAS}$ assertion to column address not valid	t_{AR}	$9.75 \times T_C - 4.0$	117.9	—	ns
176	Column address valid to $\overline{RAS}$ deassertion	t_{RAL}	$7 \times T_C - 4.0$	83.5	—	ns
177	$\overline{WR}$ deassertion to $\overline{CAS}$ assertion	t_{RCS}	$5 \times T_C - 3.8$	58.7	—	ns
178	$\overline{CAS}$ deassertion to $\overline{WR}$ assertion	t_{RCH}	$1.75 \times T_C - 3.7$	18.2	—	ns
179	$\overline{RAS}$ deassertion to $\overline{WR}$ assertion	t_{RRH}	$0.25 \times T_C - 3.0$	0.1	—	ns
180	$\overline{CAS}$ assertion to $\overline{WR}$ deassertion	t_{WCH}	$6 \times T_C - 4.2$	70.8	—	ns
181	$\overline{RAS}$ assertion to $\overline{WR}$ deassertion	t_{WCR}	$9.5 \times T_C - 4.2$	114.6	—	ns
182	$\overline{WR}$ assertion pulse width	t_{WP}	$15.5 \times T_C - 4.5$	189.3	—	ns
183	$\overline{WR}$ assertion to $\overline{RAS}$ deassertion	t_{RWL}	$15.75 \times T_C - 4.3$	192.6	—	ns
184	$\overline{WR}$ assertion to $\overline{CAS}$ deassertion	t_{CWL}	$14.25 \times T_C - 4.3$	180.1	—	ns
185	Data valid to $\overline{CAS}$ assertion (write)	t_{DS}	$8.75 \times T_C - 4.0$	105.4	—	ns

Table 2-17 DRAM Out-of-Page and Refresh Timings, Fifteen Wait States[1, 2] (Continued)

No.	Characteristics[3]	Symbol	Expression	80 MHz		Unit
				Min	Max	
186	$\overline{CAS}$ assertion to data not valid (write)	t_{DH}	$6.25 \times T_C - 4.0$	74.1	—	ns
187	$\overline{RAS}$ assertion to data not valid (write)	t_{DHR}	$9.75 \times T_C - 4.0$	117.9	—	ns
188	$\overline{WR}$ assertion to $\overline{CAS}$ assertion	t_{WCS}	$9.5 \times T_C - 4.3$	114.5	—	ns
189	$\overline{CAS}$ assertion to $\overline{RAS}$ assertion (refresh)	t_{CSR}	$1.5 \times T_C - 4.0$	14.8	—	ns
190	$\overline{RAS}$ deassertion to $\overline{CAS}$ assertion (refresh)	t_{RPC}	$4.75 \times T_C - 4.0$	55.4	—	ns
191	$\overline{RD}$ assertion to $\overline{RAS}$ deassertion	t_{ROH}	$15.5 \times T_C - 4.0$	189.8	—	ns
192	$\overline{RD}$ assertion to data valid	t_{GA}	$14 \times T_C - 6.5$	—	168.5	ns
193	$\overline{RD}$ deassertion to data not valid[3]	t_{GZ}		0.0	—	ns
194	$\overline{WR}$ assertion to data active		$0.75 \times T_C - 0.3$	9.1	—	ns
195	$\overline{WR}$ deassertion to data high impedance		$0.25 \times T_C$	—	3.1	ns

Note: 1. The number of wait states for out-of-page access is specified in the DCR.
2. The refresh period is specified in the DCR.
3. $\overline{RD}$ deassertion will always occur after $\overline{CAS}$ deassertion; therefore, the restricted timing is t_{OFF} and not t_{GZ}.

Table 2-18 External Bus Synchronous Timings (SRAM Access)[4]

No.	Characteristics	Expression[1,2]	80 MHz		Unit
			Min	Max	
196	CLKOUT high to $\overline{BS}$ assertion	$0.25 \times T_C + 4.5$	4.1	7.6	ns
197	CLKOUT high to $\overline{BS}$ deassertion	$0.75 \times T_C + 4.5$	10.4	13.9	ns
198	CLKOUT high to address and AA valid CLKOUT high to $\overline{BL}$ valid	$0.25 \times T_C + 4.5$	— —	7.6 5.0	ns ns
199	CLKOUT high to address and AA invalid CLKOUT high to $\overline{BL}$ invalid	$0.25 \times T_C$	3.1 0.0	— —	ns ns
200	$\overline{TA}$ valid to CLKOUT high (setup time)		5.0	—	ns
201	CLKOUT high to $\overline{TA}$ invalid (hold time)		0.0	—	ns
202	CLKOUT high to data out active	$0.25 \times T_C$	3.1	—	ns
203	CLKOUT high to data out valid	$0.25 \times T_C + 4.5$	4.1	7.6	ns
204	CLKOUT high to data out invalid	$0.25 \times T_C$	3.1	—	ns
205	CLKOUT high to data out high impedance	$0.25 \times T_C + 0.5$	—	3.6	ns
206	Data in valid to CLKOUT high (setup)		5.0	—	ns
207	CLKOUT high to data in invalid (hold)		0.0	—	ns
208	CLKOUT high to $\overline{RD}$ assertion	$0.75 \times T_C + 4.5$	10.4	13.9	ns
209	CLKOUT high to $\overline{RD}$ deassertion		0.0	4.5	ns

Table 2-18 External Bus Synchronous Timings (SRAM Access)[4] (Continued)

No.	Characteristics	Expression[1, 2]	80 MHz		Unit
			Min	Max	
210	CLKOUT high to $\overline{WR}$ assertion[3] • WS = 1 or WS ≥ 4 • 2 ≤ WS ≤ 3	$0.5 \times T_C + 4.8$	7.6 1.3	11.1 4.8	ns ns
211	CLKOUT high to $\overline{WR}$ deassertion		0.0	4.3	ns

Note:
1. WS is the number of wait states specified in the BCR.
2. The asynchronous delays specified in the expressions are valid for DSP56305.
3. If WS > 1, $\overline{WR}$ assertion refers to the next rising edge of CLKOUT.
4. External bus synchronous timings should be used only for reference to the clock and *not* for relative timings.

346	HRST Assertion to Host Port Pins High Impedance[2]		—	25.0	ns

Table 2-20 Universal Bus Mode Timing Parameters (Continued)

No.	Characteristic	Expression	80 MHz Min	80 MHz Max	Unit

Note:
1. The Data Strobe is $\overline{HRD}$ or $\overline{HWR}$ in the Dual Data Strobe mode and $\overline{HDS}$ in the Single Data Strobe mode.
2. HTA, HDRQ, and HRST may be programmed as active-high or active-low. In the example timing diagrams, HDRQ and HRST are shown as active-high and HTA is shown as active low.
3. The Read Data Strobe is $\overline{HRD}$ in the Dual Data Strobe mode and $\overline{HDS}$ in the Single Data Strobe mode.
4. The Write Data Strobe is $\overline{HWR}$ in the Dual Data Strobe mode and $\overline{HDS}$ in the Single Data Strobe mode.
5. HTA requires an external pull-down resistor if programmed as active high (HTAP = 0); or an external pull-up resistor if programmed as active low (HTAP = 1). The resistor value should be consistent with the DC specifications.
6. $\overline{HIRQ}$ requires an external pull-up resistor if programmed as open drain (HIRD = 0). The resistor value should be consistent with the DC specifications.
7. "LT" is the value of the latency timer register (CLAT) as programmed by the user during self configuration.
8. Values are valid for $V_{CC} = 3.3 \pm$

Table 2-21 Universal Bus Mode, Synchronous Port A Type Host Timing

No.	Characteristic	Expression	80 MHz Min	80 MHz Max	Unit
300	Access Cycle Time	$3 \times T_C$	37.5	—	ns
301	HA[10:0], HAEN Setup to Data Strobe Assertion[1]		7.0	—	ns
302	HA[10:0], HAEN Valid Hold from Data Strobe Deassertion		0.0	—	ns

No.	Characteristic	Expression	80 MHz		Unit
			Min	Max	
324	HTA Assertion to Data Strobe Deassertion[1,2]		0.0	—	ns
325	HTA High Impedance from Data Strobe Deassertion[1,2]		—	18.5	ns
326	$\overline{\text{HIRQ}}$ Asserted Pulse Width (HIRH = 0, HIRD = 1)	$(LT + 1) \times T_C - 6.0$[7]	6.5	—	ns
327	Data Strobe Deasserted Hold from $\overline{\text{HIRQ}}$ Deassertion (HIRH = 0)[1]		0.0	—	ns
328	$\overline{\text{HIRQ}}$ Asserted Hold from Data Strobe Assertion (HIRH = 1)[1]	$2.5 \times T_C$	31.3	—	ns
329	$\overline{\text{HIRQ}}$ Deassertion from Data Strobe Assertion (HIRH = 1, HIRD = 1)[1]	$3.5 \times T_C + 28.0$	—	68.4	ns
330	$\overline{\text{HIRQ}}$ High Impedance from Data Strobe Assertion (HIRH = 1, HIRD = 0)[1,6]	$3.5 \times T_C + 28.0$	—	68.4	ns
331	$\overline{\text{HIRQ}}$ Active from Data Strobe Deassertion (HIRH = 1, HIRD = 0)[1]	$2.5 \times T_C$	31.3	—	ns
332	$\overline{\text{HIRQ}}$ Deasserted Hold from Data Strobe Deassertion[1]	$2.5 \times T_C$	31.3	—	ns
346	HRST Assertion to Host Port Pins High Impedance[2]		—	25.0	ns
347	$\overline{\text{HBS}}$ Assertion to CLKOUT Rising Edge		5.2	—	ns
348	Data Strobe Deassertion to CLKOUT Rising Edge[1]		9.0	—	ns

Note:
1. The Data Strobe is $\overline{\text{HRD}}$ or $\overline{\text{HWR}}$ in the Dual Data Strobe mode; and $\overline{\text{HDS}}$ in the Single Data Strobe mode.
2. The Read Data Strobe is $\overline{\text{HRD}}$ in the Dual Data Strobe mode and $\overline{\text{HDS}}$ in the Single Data Strobe mode.
3. The Write Data Strobe is $\overline{\text{HWR}}$ in the Dual Data Strobe mode and $\overline{\text{HDS}}$ in the Single Data Strobe mode.
4. HTA, HDRQ, and HRST may be programmed as active-high or active-low. In the following timing diagrams, HDRQ and HRST are shown as active-high and HTA is shown as active low.
5. HTA requires an external pull-up resistor if programmed as active high (HTAP = 0); or an external pull-down resistor if programmed as active low (HTAP = 1). The resistor value should be consistent with the DC specifications.
6. $\overline{\text{HIRQ}}$ requires an external pull-up resistor if programmed as open drain (HIRD = 0). The resistor value should be consistent with the DC specifications.
7. "LT" is the value of the latency timer register (CLAT) as programmed by the user during self configuration.

Table 2-22   PCI Mode Timing Parameters[1]

No.	Characteristic[10]	Symbol	80 MHz		Unit
			Min	Max	
349	HCLK to Signal Valid Delay—Bussed Signals	t_{VAL}	2.0	11.0	ns
350	HCLK to Signal Valid Delay—Point to Point	$t_{VAL(ptp)}$	2.0	12.0	ns
351	Float to Active Delay	t_{ON}	2.0	—	ns
352	Active to Float Delay	t_{OFF}	—	28.0	ns
353	Input Set Up Time to HCLK—Bussed Signals	t_{SU}	7.0	—	ns
354	Input Set Up Time to HCLK—Point to Point	$t_{SU(ptp)}$	10.0, 12.0	—	ns
355	Input Hold Time from HCLK	t_H	0.0	—	ns
356	Reset Active Time After Power Stable	t_{RST}	1.0	—	ms
357	Reset Active Time After HCLK Stable	$t_{RST-CLK}$	100.0	—	μs
358	Reset Active to Output Float Delay	$t_{RST-OFF}$	—	40.0	ns
359	HCLK Cycle Time	t_{CYC}	30.0	—	ns
360	HCLK High Time	t_{HIGH}	11.0	—	ns
361	HCLK Low Time	t_{LOW}	11.0	—	ns
Note:	1. See PCI Local Bus Specification, Rev. 2.0. 2. The HI32 supports these timings for a PCI bus operating at 33 MHz for a DSP clock frequency of 56 MHz and above. The DSP core operating frequency should be greater than 5/3 of the PCI bus frequency to maintain proper PCI operation. 3. HGNT has a setup time of 10 ns. HREQ has a setup time of 12 ns.

Table 2-23 SCI Timing

No.	Characteristics[1]	Symbol	Expression	80 MHz Min	80 MHz Max	Unit
400	Synchronous clock cycle	t_{SCC}[2]	$8 \times T_C$	100.0	—	ns
401	Clock low period		$t_{SCC}/2 - 10.0$	40.0	—	ns
402	Clock high period		$t_{SCC}/2 - 10.0$	40.0	—	ns
403	Output data setup to clock falling edge (internal clock)		$t_{SCC}/4 + 0.5 \times T_C - 17.0$	14.3	—	ns
404	Output data hold after clock rising edge (internal clock)		$t_{SCC}/4 - 0.5 \times T_C$	18.8	—	ns
405	Input data setup time before clock rising edge (internal clock)		$t_{SCC}/4 + 0.5 \times T_C + 25.0$	56.3	—	ns
406	Input data not valid before clock rising edge (internal clock)		$t_{SCC}/4 + 0.5 \times T_C - 5.5$	—	25.8	ns
407	Clock falling edge to output data valid (external clock)			—	32.0	ns
408	Output data hold after clock rising edge (external clock)		$T_C + 8.0$	20.5	—	ns
409	Input data setup time before clock rising edge (external clock)			0.0	—	ns
410	Input data hold time after clock rising edge (external clock)			9.0	—	ns
411	Asynchronous clock cycle	t_{ACC}[3]	$64 \times T_C$	800.0	—	ns
412	Clock low period		$t_{ACC}/2 - 10.0$	390.0	—	ns
413	Clock high period		$t_{ACC}/2 - 10.0$	390.0	—	ns
414	Output data setup to clock rising edge (internal clock)		$t_{ACC}/2 - 30.0$	370.0	—	ns
415	Output data hold after clock rising edge (internal clock)		$t_{ACC}/2 - 30.0$	370.0	—	ns

Note: 1. $V_{CC} = 3.3$ V ± 0.3 V; $T_J = -40°$C to $+100$ °C, $C_L = 50$ pF + 2 TTL Loads
2. t_{SCC} = synchronous clock cycle time (For internal clock, t_{SCC} is determined by the SCI clock control register and T_C.)
3. t_{ACC} = asynchronous clock cycle time; value given for 1X Clock mode (For internal clock, t_{ACC} is determined by the SCI clock control register and T_C.)
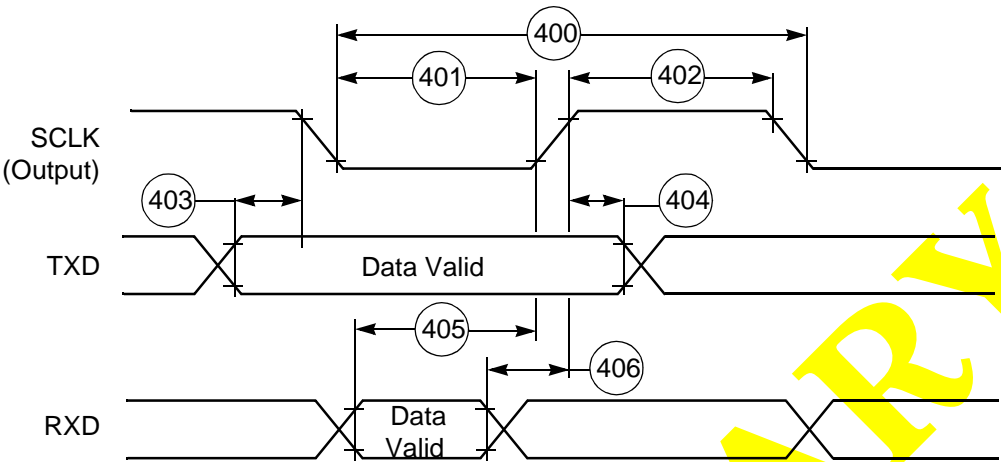

a) Internal Clock
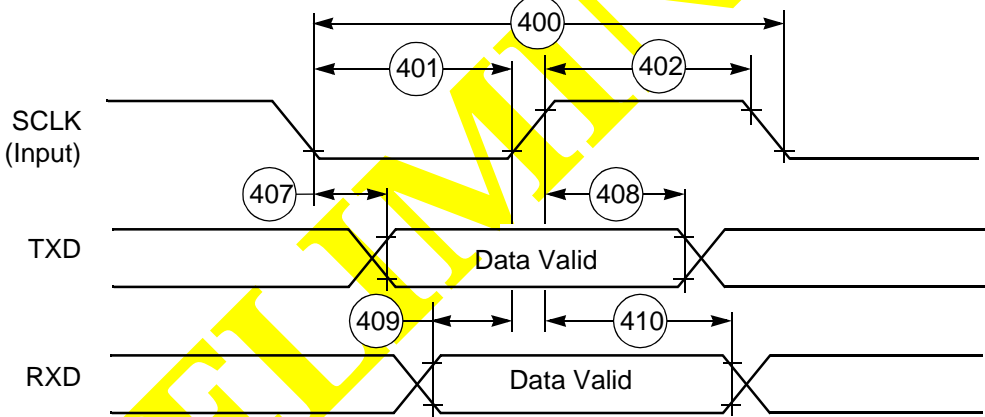

b) External Clock

Table 2-24 ESSI Timings (Continued)

No.	Characteristics[4, 6, 7]	Symbol	Expression	80 MHz		Cond-ition[5]	Unit
				Min	Max		
Note: 1. For the internal clock, the external clock cycle is defined by I_{cyc} and the ESSI control register. 2. The word-relative frame sync signal waveform relative to the clock operates in the same manner as the bit-length frame sync signal waveform, but spreads from one serial clock before first bit clock (same as Bit Length Frame Sync signal), until the one before last bit clock of the first word in frame. 3. Periodically sampled and not 100% tested 4. V_{CC} = 3.3 V ± 0.3 V; T_J = −40°C to +100 °C, C_L = 50 pF + 2 TTL Loads 5. TXC (SCK Pin) = Transmit Clock RXC (SC0 or SCK Pin) = Receive Clock FST (SC2 Pin) = Transmit Frame Sync FSR (SC1 or SC2 Pin) Receive Frame Sync 6. i ck = Internal Clock x ck = External Clock i ck a = Internal Clock, Asynchronous Mode (Asynchronous implies that TXC and RXC are two different clocks) i ck s = Internal Clock, Synchronous Mode (Synchronous implies that TXC and RXC are the same clock) 7. bl = bit length wl = word length wr = word length relative							
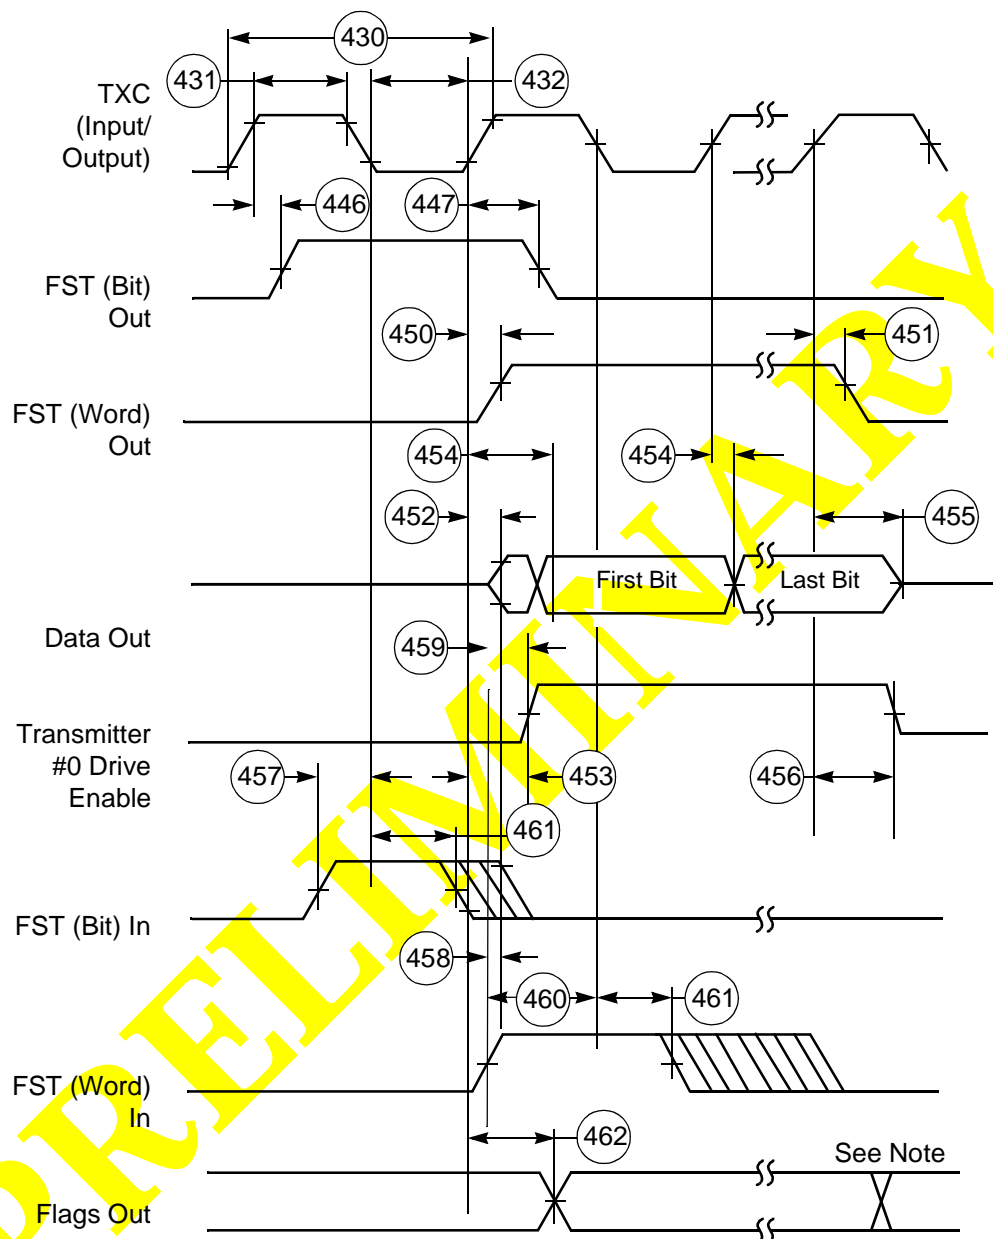

Note: 1. In Network mode, output flag transitions can occur at the start of each time slot within the frame. In Normal mode, the output flag state is asserted for the entire frame period.

SECTION 3

PACKAGING

PIN-OUT AND PACKAGE INFORMATION

This sections provides information about the available packages for this product, including diagrams of the package pinouts and tables describing how the signals described in **Section 1** are allocated for each package.

The DSP56305 is available in a 252-pin Plastic Ball Grid Array (PBGA) package.

PBGA Package Description

Top and bottom views of the PBGA package are shown in **Figure 3-1** and **Figure 3-2** with their pin-outs.

Note:　1.　Signal names are based on configured functionality. Most connections supply a single signal. Some connections provide a signal with dual functionality, such as the MODx/$\overline{\text{IRQx}}$ pins that select an operating mode after $\overline{\text{RESET}}$ is deasserted, but act as interrupt lines during operation. Some signals have configurable polarity; these names are shown with and without overbars, such as $\overline{\text{HAS}}$/HAS. Some connections have two or more configurable functions; names assigned to these connections indicate the function for a specific configuration. For example, connection N2 is data line H7 in non-multiplexed bus mode, data/address line HAD7 in multiplexed bus mode, or GPIO line PB7 when the GPIO function is enabled for this pin. Unlike the TQFP package, most of the GND pins are connected internally in the center of the connection array and act as heat sink for the chip. Therefore, except for GND_P and GND_{P1} that support the PLL, other GND signals do not support individual subsystems in the chip.

　　　　　2.　NC stands for Not Connected. These pins are reserved for future development. Do not connect and line, component, trace, or via to these pins.

ORDERING DRAWINGS

Complete mechanical information regarding DSP56305 packaging is available by facsimile through Motorola's Mfax™ system. Call the following number to obtain information by facsimile:

<div style="border:1px solid black;">

(602) 244-6591

</div>

The Mfax automated system requests the following information:

- The receiving facsimile telephone number including area code or country code

- The caller's Personal Identification Number (PIN)

Note: For first time callers, the system provides instructions for setting up a PIN, which requires entry of a name and telephone number.

- The type of information requested:

  – Instructions for using the system

  – A literature order form

  – Specific part technical information or data sheets

  – Other information described by the system messages

A total of three documents may be ordered per call.

The reference number for the 252-pin PBGA package is 1205-01.

SECTION 4

DESIGN CONSIDERATIONS

THERMAL DESIGN CONSIDERATIONS

An estimation of the chip junction temperature, T_J, in °C can be obtained from the equation:

Equation 1: $T_J = T_A + (P_D \times R_{\theta JA})$

Where:

T_A = ambient temperature °C
$R_{\theta JA}$ = package junction-to-ambient thermal resistance °C/W
P_D = power dissipation in package

Historically, thermal resistance has been expressed as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

Equation 2: $R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$

Where:

$R_{\theta JA}$ = package junction-to-ambient thermal resistance °C/W
$R_{\theta JC}$ = package junction-to-case thermal resistance °C/W
$R_{\theta CA}$ = package case-to-ambient thermal resistance °C/W

$R_{\theta JC}$ is device-related and cannot be influenced by the user. The user controls the thermal environment to change the case-to-ambient thermal resistance, $R_{\theta CA}$. For example, the user can change the air flow around the device, add a heat sink, change the mounting arrangement on the printed circuit board, or otherwise change the thermal dissipation capability of the area surrounding the device on a printed circuit board. This model is most useful for ceramic packages with heat sinks; some 90% of the heat flow is dissipated through the case to the heat sink and out to the ambient environment. For ceramic packages, in situations where the heat flow is split between a path to the case and an alternate path through the printed circuit board, analysis of the device thermal performance may need the additional modeling capability of a system level thermal simulation tool.

The thermal performance of plastic packages is more dependent on the temperature of the printed circuit board to which the package is mounted. Again, if the estimations obtained from $R_{\theta JA}$ do not satisfactorily answer whether the thermal performance is adequate, a system level model may be appropriate.

A complicating factor is the existence of three common ways for determining the junction-to-case thermal resistance in plastic packages:

- To minimize temperature variation across the surface, the thermal resistance is measured from the junction to the outside surface of the package (case) closest to the chip mounting area when that surface has a proper heat sink.

- To define a value approximately equal to a junction-to-board thermal resistance, the thermal resistance is measured from the junction to where the leads are attached to the case.

- If the temperature of the package case (T_T) is determined by a thermocouple, the thermal resistance is computed using the value obtained by the equation $(T_J - T_T)/P_D$.

As noted above, the junction-to-case thermal resistances quoted in this data sheet are determined using the first definition. From a practical standpoint, that value is also suitable for determining the junction temperature from a case thermocouple reading in forced convection environments. In natural convection, using the junction-to-case thermal resistance to estimate junction temperature from a thermocouple reading on the case of the package will estimate a junction temperature slightly hotter than actual temperature. Hence, the new thermal metric, Thermal Characterization Parameter or Ψ_{JT}, has been defined to be
$(T_J - T_T)/P_D$. This value gives a better estimate of the junction temperature in natural convection when using the surface temperature of the package. Remember that surface temperature readings of packages are subject to significant errors caused by inadequate attachment of the sensor to the surface and to errors caused by heat loss to the sensor. The recommended technique is to attach a 40-gauge thermocouple wire and bead to the top center of the package with thermally conductive epoxy.

ELECTRICAL DESIGN CONSIDERATIONS

CAUTION

This device contains protective circuitry to guard against damage due to high static voltage or electrical fields. However, normal precautions are advised to avoid application of any voltages higher than maximum rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (e.g., either GND or V_{CC}).

Use the following list of recommendations to assure correct DSP operation:

- Provide a low-impedance path from the board power supply to each V_{CC} pin on the DSP, and from the board ground to each GND pin.

- Use at least six 0.01–0.1 μF bypass capacitors positioned as close as possible to the four sides of the package to connect the V_{CC} power source to GND.

- Ensure that capacitor leads and associated printed circuit traces that connect to the chip V_{CC} and GND pins are less than 0.5 in per capacitor lead.

- Use at least a four-layer Printed Circuit Board (PCB) with two inner layers for V_{CC} and GND.

- Because the DSP output signals have fast rise and fall times, PCB trace lengths should be minimal. This recommendation particularly applies to the address and data buses as well as the $\overline{\text{IRQA}}$, $\overline{\text{IRQB}}$, $\overline{\text{IRQC}}$, $\overline{\text{IRQD}}$, $\overline{\text{TA}}$, and $\overline{\text{BG}}$ pins. Maximum PCB trace lengths on the order of 6 inches are recommended.

- Consider all device loads as well as parasitic capacitance due to PCB traces when calculating capacitance. This is especially critical in systems with higher capacitive loads that could create higher transient currents in the V_{CC} and GND circuits.

- Every input pin (except $\overline{\text{TRST}}$, TMS, and $\overline{\text{DE}}$—these three pins have internal pull-up resistors) should be driven to a valid value after deassertion of RESET (i.e., each pin should be connected to a pull-up or pull-down resistor if not used). However, if HRST is kept asserted, only HFRAME and HCLK require a pull-up resistor or connection to VCC; the remaining HI32 pins do not require external pull-up or pull-down connections. Unused outputs may be left

---

unconnected. Unused GPIO pins may either be connected to pull-up or pull-down resistors, or, defined as outputs and left unconnected.

- Take special care to minimize noise levels on the V_{CCP}, GND_P, and GND_{P1} pins.

- The following pins must be asserted after power-up: $\overline{RESET}$ and $\overline{TRST}$ (see **Note 4** in **Table 2-7**).

- If multiple DSP56305 devices are on the same board, check for cross-talk or excessive spikes on the supplies due to synchronous operation of the devices.

POWER CONSUMPTION CONSIDERATIONS

Power dissipation is a key issue in portable DSP applications. Some of the factors which affect current consumption are described in this section. Most of the current consumed by CMOS devices is Alternating Current (AC), which is charging and discharging the capacitances of the pins and internal nodes.

Current consumption is described by the formula:

Equation 3: $I = C \times V \times f$

where: C = node/pin capacitance
           V = voltage swing
           f = frequency of node/pin toggle

Example 4-1 Current Consumption

For a Port A address pin loaded with 50 pF capacitance, operating at 3.3 V, and with a 66 MHz clock, toggling at its maximum possible rate (33 MHz), the current consumption is:

Equation 4: $I = 50 \times 10^{-12} \times 3.3 \times 33 \times 10^{6} = 5.48 \ mA$

The Maximum Internal Current (I_{CCI}max) value reflects the typical possible switching of the internal buses on worst-case operation conditions, which is not necessarily a real application case. The Typical Internal Current (I_{CCItyp}) value reflects the average switching of the internal buses on typical operating conditions.

For applications that require very low current consumption:

- Set the EBD bit when not accessing external memory.

- Minimize external memory accesses, and use internal memory accesses.

- Minimize the number of pins that are switching.

- Minimize the capacitive load on the pins.

- Connect the unused inputs to pull-up or pull-down resistors. Unused outputs may be left unconnected. Unused GPIO pins may either be connected to pull-up or pull-down resistors, or defined as outputs and left unconnected.

- Disable unused peripherals.

- Disable unused pin activity (e.g., CLKOUT, XTAL).

One way to evaluate power consumption is to use a current per MIPS measurement methodology to minimize specific board effects (i.e., to compensate for measured board current not caused by the DSP). A benchmark power consumption test algorithm is listed in **Appendix A**. Use the test algorithm, specific test current measurements, and the following equation to derive the current per MIPS value:

Equation 5: $I/MIPS = I/MHz = (I_{typF2} - I_{typF1})/(F2 - F1)$

where: I_{typF2} = current at F2
I_{typF1} = current at F1
F2 = high frequency (any specified operating frequency)
F1 = low frequency (any specified operating frequency lower than F2)

Note: F1 should be significantly less than F2. For example, F2 could be 66 MHz and F1 could be 33 MHz. The degree of difference between F1 and F2 determines the amount of precision with which the current rating can be determined for an application.

PLL PERFORMANCE ISSUES

The following explanations should be considered as general observations on expected PLL behavior. There is no testing that verifies these exact numbers. These observations were measured on a limited number of parts and were not verified over the entire temperature and voltage ranges.

Phase Skew Performance

The phase skew of the PLL is defined as the time difference between the falling edges of EXTAL and CLKOUT for a given capacitive load on CLKOUT, over the entire process, temperature and voltage ranges. As defined in **Figure 2-2** on page 2-7, for input frequencies greater than 15 MHz and the Multiplication Factor (MF) ≤ 4, this skew is greater than or equal to 0.0 ns and less than 1.8 ns; otherwise, this skew is not guaranteed. However, for MF < 10 and input frequencies greater than 10 MHz, this skew is between –1.4 ns and +3.2 ns.

Phase Jitter Performance

The phase jitter of the PLL is defined as the variations in the skew between the falling edges of EXTAL and CLKOUT for a given device in specific temperature, voltage, input frequency, MF, and capacitive load on CLKOUT. These variations are a result of the PLL locking mechanism. For input frequencies greater than 15 MHz and MF ≤ 4, this jitter is less than ±0.6 ns; otherwise, this jitter is not guaranteed. However, for MF < 10 and input frequencies greater than 10 MHz, this jitter is less than ±2 ns.

Frequency Jitter Performance

The frequency jitter of the PLL is defined as the variation of the frequency of CLKOUT. For small MF (MF < 10) this jitter is smaller than 0.5%. For mid-range MF (10 < MF < 500) this jitter is between 0.5% and ~2%. For large MF (MF > 500), the frequency jitter is 2–3%.

Input (EXTAL) Jitter Requirements

The allowed jitter on the frequency of EXTAL is 0.5%. If the rate of change of the frequency of EXTAL is slow (i.e., it does not jump between the minimum and maximum values in one cycle) or the frequency of the jitter is fast (i.e., it does not stay at an extreme value for a long time), then the allowed jitter can be 2%. The phase and frequency jitter performance results are only valid if the input jitter is less than the prescribed values.

APPENDIX B

DSP56305 BOOTSTRAP CODE LISTING

```
; BOOTSTRAP CODE FOR DSP56305 - (C) Copyright 1996 Motorola Inc.
; Revised June 18, 1996.
;
; Bootstrap through the Host Interface, External EPROM or SCI.
;
; This  is the Bootstrap  program  contained  in the DSP56305 192-word  Boot
; ROM.  This  program  can  load  any program  RAM segment  from an external
; EPROM, from the Host Interface or from the SCI serial interface.
;
;
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
; If MD:MC:MB:MA=x000,  then  the  Boot  ROM is bypassed  and the DSP56305
; will start fetching instructions  beginning  with address $C00000 (MD=0)
; or $008000  (MD=1)  assuming  that  an external  memory  of SRAM type is
; used.  The accesses  will  be performed  using  31 wait  states with no address
; attributes selected (default area).
;
;
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
; If  MD:MC:MB:MA=x001,   then   it  loads  a  program  RAM segment   from
; consecutive  byte-wide  P memory  locations,  starting  at P:$D00000 (bits
; 7-0).  The  memory  is  selected  by  the  Address  Attribute AA1  and  is
; accessed with 31 wait states.
;
; The EPROM  bootstrap  code expects  first  to read 3 bytes specifying  the
; number  of program  words,  afterwards  3 bytes specifying  the address  to
; start  loading  the program  words  and then 3 bytes for each program  word
; to be loaded.  The number of words,  the starting  address  and the program
; words  are  read  least  significant  byte  first  followed  by the mid and
; then by the most significant byte.
;
; The program  words  will  be condensed  into  24-bit  words  and stored  in
; contiguous  PRAM  memory  locations  starting  at  the  specified starting
; address.   After  reading  the  program  words,  program  execution starts
; from the same address where loading started.
;
;
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
; If MD:MC:MB:MA=x010, then it loads the program RAM from the SCI interface.
;
```

```
; The SCI bootstrap  code expects  first  to receive  3 bytes specifying  the
; number  of program  words,  afterwards  3 bytes specifying  the address  to
; start  loading  the program  words  and then 3 bytes for each program  word
; to be loaded.  The number of words,  the starting  address  and the program
; words  are received  least significant  byte first followed  by the mid and
; then by the most significant byte.
;
; The program  words  will  be condensed  into  24-bit  words  and stored  in
; contiguous  PRAM  memory  locations  starting  at  the  specified  starting
; address.  After  reading  the  program  words,  program  execution  starts
; from the same address where loading started.
;
; The SCI is programmed  to work  in asynchronous  mode  with 8 data bits,  1
; stop  bit  and  no parity.  The  clock  source  is external  and  the clock
; frequency  must  be 16x the baud  rate.  After  each  byte is received,  it
; is echoed back through the SCI transmitter.
;
;
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
; If MD:MC:MB:MA=x011,  then it loads the program RAM from the Host Interface
; programmed to operate in the Universal Bus mode supporting 56305-to-56305
; glue less connection.
;
; The HI32  bootstrap  code expects  first  to read a 24-bit  word specifying
; the number  of program  words,  afterwards  a 24-bit  word  specifying  the
; address  to start  loading  the program  words  and then  24-bit  word  for
; each  program  word  to be loaded.
;
; The  program  words  will  be  stored  in  contiguous  PRAM  memory
; locations  starting  at  the  specified  starting  address.  After
; reading  the  program  words,  program  execution  starts  from  the  same
; address where loading started.
;
; The Host Interface  bootstrap  load program  may be stopped  by setting the
; Host  Flag  0 (HF0)  in HCTR  register.  This will start  execution  of the
; loaded program from the specified starting address.
;
; During  the access,  the HAEN and HA10-HA3  pins must be driven  low;  pins
; HA2-HA0 select the HI32 registers.
; Before  booting  through  the Host  Interface  it is recommended  that  the
; Host  boot  program  will verify  that the HI32 is operational,  by reading
; the status register (HSTR) and confirm that its value is $3.
;
; Suggested 56305-to-56305 connection:
;
;   slave    master
;   56305/HI32     56305/PortA
```

```
;
;   HA[10:3]   <-  A[10:3]          ; selects HI32 (base address 00000000)
;   HA[2:0]    <-  A[2:0]           ; selects HTXR registers
;   HD[24:0]   <-> D[24:0]          ; Data bus
;   HBS_       <-  BS_              ; Bus Strobe (optional, see Note1)
;   HAEN       <-  AAx              ; DMA cycle disable (AAx is active low)
;   HTA        ->  TA_              ; Transfer Acknowledge (optional, see Note2)
;   HIRQ_      ->  IRQx_            ; Interrupt Request (active low, open drain)
;   HWR_       <-  WR_              ; Write strobe
;   HRD_       <-  RD_              ; Read strobe
;   HRST       <-  system reset     ; Reset (active low)
;
; Pins  HP31,  HP32  and HDAK_  must  be tied to Vcc.  Pins HP[22:20]  may be
; used  as GPIO pins.  Pin HINTA_  may be used as software  driven  interrupt
; request pin.
;
; Note1:  If HBS_  to BS_  connection is used,  the synchronous  connection of
; the  HI32  is  used  and  therefore  the  56305/master  should  access  the
; 56305/slave  as  SRAM  with  2 wait  states.  In  addition  the  CLKOUT  of
; 56305/master  should  be  connected  to  EXTAL  of  56305/slave,  and  both
; master  and  slave  should  enable  the  PLL  while  in  the  case  of slave
; multiplication,   division  and  pre-division   factors  should  be  one  to
; guarantee synchronization between master and slave.
; In the case of asynchronous connection, HBS_ must be tied to Vcc.
;
; Note2:  If HTA  to HTA_  connection  is not  used,  it is recommended  that
; the  HOST  Processor's  boot  program  will  verify  that the Host Interface
; is ready,  by reading  the status register  (HSTR)  and confirm that TRDY=1
; or HTRQ=1.
;
;
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
; If MD:MC:MB:MA=x100, then it loads the program RAM from the Host
; Interface programmed to operate in the PCI target (slave) mode.
;
; The HI32  bootstrap  code expects  first  to read a 24-bit  word specifying
; the number  of program  words,  afterwards a 24-bit  word  specifying  the
; address  to start  loading  the program  words  and then  24-bit  word  for
; each  program  word  to be loaded.
;
; The  program  words  will  be  stored  in  contiguous  PRAM  memory
; locations  starting  at  the  specified  starting  address.  After
; reading  the  program  words,  program  execution  starts  from  the  same
; address where loading started.
;
; The Host Interface  bootstrap  load program  may be stopped  by setting the
; Host  Flag  0 (HF0)  in HCTR  register.  This will start  execution  of  the
```

```
; loaded program from the specified starting address.
;
; The HOST Processor  must first   configure  the Host Interface  as PCI slave
; and then   start   writing   data  to the Host  Interface.  The HOST Processor
; must  program  the  HCTR  HTF1-HTF0  bits  as  01,  10  or  11  and  then
; correspondingly drive the 24-bit data mapped into 32-bit PCI bus word.
;
; Note  that  for the synchronization  purposes,  the DSP to PCI clock  ratio
; should be more then 5/3.
;
;
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
; If MD:MC:MB:MA=x101, then it loads the program RAM from the Host
; Interface programmed to operate in the Universal Bus mode supporting
; ISA (slave) glue less connection.
;
; Using  self  configuration  mode,  the base  address  in CBMA  is initially
; written  with  $2f  which  corresponds  to  an  ISA  HTXR  address  of $2fe
; (Serial Port 2 Modem Status read only register).
;
; The HI32 bootstrap code expects to read 32 consecutive times the "magic
; number" $0037. Subsequently the bootstrap code expects to read a 16-bit word
; which is the designated ISA Port Address; this address is written into the
; CBMA. The HOST Processor must poll for the Host Interface to be re-configured.
; This must be done by reading the HSTR and verifying that the value $0013 is
; read. From this moment the HOST Processor may start writing data to the
; Host Interface.
;
; The  HI32  bootstrap  code  expects  first  to  read  a  24-bit  word  (see
; Note  below)  specifying  the  number  of  program  words,   afterwards  a
; 24-bit  word  specifying   the  address   to  start  loading   the  program
; words and then 24-bit word for each program word to be loaded.
;
; The   program   words   will   be   stored   in  contiguous   PRAM   memory
; locations   starting   at   the   specified   starting   address.    After
; reading  the  program  words,   program  execution  starts  from  the  same
; address where loading started.
;
; The Host Interface  bootstrap  load program  may be stopped  by setting the
; Host  Flag  0 (HF0)  in HCTR  register.  This will start   execution  of the
; loaded program from the specified starting address.
;
; Note:  This  ISA connection  implies  16 bit data  width  access  only  and
; that  the  number  of 16-bit  wide  words  that  are  transferred  must  be
; even.
;
; The 24-bit  words  has to be packed  into  16-bit  ISA words  and then  sent
```

```
; by the HOST Processor in the following sequence:
;
;    |  M0  |  L0  |
;    |  L1  |  H0  |
;    |  H1  |  M1  |
;
; The boot program  will convert  every  three 16-bit  wide host words to two
; 24-bit wide 56305 opcodes in the following format:
;
;    |  H0  |  M0  |  L0  |
;    |  H1  |  M1  |  L1  |
;
; The Host  Processor  must  program  the Host  Interface  to operate  in the
; zero fill mode (HTF1-HTF0 = 01 in HCTR).
;
; Suggested 56305 to ISA connection:
;
;   HA[10]  <- SBHE_              ; selects HI32 (base address 10011111)
;   HA[9]   <- SA[0]             ; selects HI32 (base address 10011111)
;   HA[8:3] <- SA[9:4]          ; selects HI32 (base address 10011111)
;   HA[2:0] <- SA[3:1]          ; selects HTXR registers
;   HD[15:0] - SD[15:0]         ; Data bus
;   HD[23:16] - Not connected   ; High Data Bus - Should be pulled up or down
;   HDBEN_  -> OE_              ; Output enable of transceivers
;   HDBDR   -> DIR             ; Direction of transceivers
;   HSAK_   -> IO16_           ; 16 bit data word
;   HBS_    <- Vcc             ; Bus Strobe disabled
;   HAEN    <- AEN             ; DMA cycle enable
;   HTA     -> CHRDY           ; Channel ready
;   HWR_    <- IOWC_           ; IO/DMA write strobe
;   HRD_    <- IORC_           ; IO/DMA read strobe
;   HRST    <- inverted RSTDRV ; invert ISA reset
;
;
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
; If  MD:MC:MB:MA=x110,  then  it  loads  the  program  RAM  from  the  Host
; Interface  programmed  to  operate  in  the  Universal  Bus  (UB)  mode,  in
; double-strobe pin configuration.
;
; The HI32 bootstrap  code expects first  to receive  3 bytes specifying  the
; number  of program  words,  afterwards  3 bytes specifying  the address  to
; start  loading  the program  words  and then 3 bytes for each program  word
; to be loaded.  The number of words,  the starting  address  and the program
; words  are received  least significant  byte first followed  by the mid and
; then by the most significant byte.
;
; The program  words  will  be condensed  into  24-bit  words  and stored  in
```

```
; contiguous  PRAM  memory  locations  starting  at  the  specified  starting
; address.  After  reading  the  program  words,  program  execution  starts
; from the same address where loading started.
;
; The Host Interface  bootstrap  load program  may be stopped  by setting the
; Host  Flag  0 (HF0)  in HCTR  register.  This will start  execution  of the
; loaded program from the specified starting address.
;
; The user must externally decode the port address with active  low logic and
; connect the select line to HAEN; all the address lines shall be pulled down
; except for HA3, HA2 and HA1 that select the HOST Interface registers.
;
; When booting through the Host Interface it is recommended that the Host
; boot program will verify that the Host Interface is operational, by
; reading the status register (HSTR) and confirm that TRDY=1.
;
; When  booting  through  the  Host  Interface,  it is recommended  that  the
; HOST  Processor's  boot  program  will  verify  that the Host Interface  is
; ready,  by reading  the status  register  (HSTR)  and confirm  that  TRDY=1
; or HTRQ=1.
;
;
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
; If  MD:MC:MB:MA=x111,  then  it  loads  the  program  RAM  from  the  Host
; Interface  programmed  to  operate  in the  Universal  Bus  (UB)  mode,  in
; single-strobe pin configuration.
;
; Other than the single-strobe pin configuration, this mode is identical to
; the double-strobe pin configuration UB mode (MD:MC:MB:MA=x110).
;
;
